

Package ‘SIAMCAT’

April 12, 2022

Type Package

Title Statistical Inference of Associations between Microbial Communities And host phenoTypes

Version 1.14.0

Description Pipeline for Statistical Inference of Associations between Microbial Communities And host phenoTypes (SIAMCAT). A primary goal of analyzing microbiome data is to determine changes in community composition that are associated with environmental factors. In particular, linking human microbiome composition to host phenotypes such as diseases has become an area of intense research. For this, robust statistical modeling and biomarker extraction toolkits are crucially needed. SIAMCAT provides a full pipeline supporting data preprocessing, statistical association testing, statistical modeling (LASSO logistic regression) including tools for evaluation and interpretation of these models (such as cross validation, parameter selection, ROC analysis and diagnostic model plots).

Depends R (>= 3.6.0), mlr, phyloseq

Imports beanplot, glmnet, graphics, grDevices, grid, gridBase, gridExtra, LiblineaR, matrixStats, methods, ParamHelpers, pROC, PRROC, RColorBrewer, scales, stats, stringr, utils, infotheo, progress, corrplot

License GPL-3

accessSlot

Universal slot accessor function for siamcat-class.

Description

This function is used internally by many accessors.

Usage

```
accessSlot(siamcat, slot, verbose=1)
```

Arguments

siamcat	an object of siamcat-class .
slot	A character string indicating the slot (not data class) of the component data type that is desired.
verbose	If the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message)

Value

Returns the component object specified by the argument `slot`. Returns NULL if slot does not exist.

Examples

```
#  
data(siamcat_example)  
accessSlot(siamcat_example, "label")  
accessSlot(siamcat_example, "model_list")
```

add.meta.pred	<i>Add metadata as predictors</i>
---------------	-----------------------------------

Description

This function adds metadata to the feature matrix to be later used as predictors

Usage

```
add.meta.pred(siamcat, pred.names,  
              std.meta = TRUE,  
              feature.type='normalized',  
              verbose = 1)
```

Arguments

<code>siamcat</code>	object of class <code>siamcat-class</code>
<code>pred.names</code>	vector of names of the variables within the metadata to be added to the feature matrix as predictors
<code>std.meta</code>	boolean, should added metadata features be standardized?, defaults to TRUE
<code>feature.type</code>	string, on which type of features should the function work? Can be either "original", "filtered", or "normalized". Please only change this parameter if you know what you are doing!
<code>verbose</code>	integer, control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1

Details

This function adds one or several metadata variables to the set of features, so that they can be included for model training.

Usually, this function should be called before [train.model](#).

Numerical meta-variables are added as z-scores to the feature matrix unless specified otherwise.

Please be aware, that non-numerical metadata variables will be converted to numerical values by using `as.numeric()` and could therefore lead to errors. Thus, it makes sense to encode non-numerical metadata variables to numerically before you start the SIAMCAT workflow.

Value

an object of class `siamcat-class` with metadata added to the features

Examples

```
data(siamcat_example)

# Add the Age of the patients as potential predictor
siamcat_age_added <- add.meta.pred(siamcat_example, pred.names=c('Age'))

# Add Age and BMI as potential predictors
# Additionally, prevent standardization of the added features
siamcat_meta_added <- add.meta.pred(siamcat_example,
  pred.names=c('Age', 'BMI'),
  std.meta=FALSE)
```

associations

Retrieve the results of association testing from a SIAMCAT object

Description

Function to retrieve the results of association testing

Usage

```
associations(siamcat, verbose=1)

## S4 method for signature 'siamcat'
associations(siamcat, verbose = 1)
```

Arguments

- | | |
|---------|---|
| siamcat | (Required). An instance of siamcat-class containing the results of association testing |
| verbose | integer, if the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message) |

Details

The function returns the results of the association testing procedure as dataframe. See [check.associations](#) for more details.

Value

A `data.frame` of association testing results or `NULL`

Examples

```
data(siamcat_example)
temp <- associations(siamcat_example)
head(temp)
```

associations<-	<i>Assign a new associations object to x</i>
----------------	--

Description

Assign a new associations object to x

Usage

```
associations(x) <- value

## S4 replacement method for signature 'siamcat,list'
associations(x) <- value
```

Arguments

x	an object of class siamcat-class
value	an associations object

Value

none

Examples

```
data(siamcat_example)
associations(siamcat_example) <- list(
  'assoc.results'=associations(siamcat_example),
  'assoc.param'=assoc_param(siamcat_example))
```

assoc_param	<i>Retrieve the list of parameters for association testing from a SIAMCAT object</i>
-------------	--

Description

Function to retrieve the list of parameters for association testing

Usage

```
assoc_param(siamcat, verbose=1)

## S4 method for signature 'siamcat'
assoc_param(siamcat, verbose = 1)
```

Arguments

- | | |
|----------------------|---|
| <code>siamcat</code> | (Required). An instance of siamcat-class containing the results from association testing |
| <code>verbose</code> | integer, if the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message) |

Details

The function returns the list of parameters used in association testing. See **check.associations** for more details.

Value

A list of parameters for association testing or NULL

Examples

```
data(siamcat_example)
temp <- assoc_param(siamcat_example)
names(temp)
```

check.associations *Check and visualize associations between features and classes*

Description

This function computes different measures of association between features and the label and visualizes the results

Usage

```
check.associations(siamcat, fn.plot=NULL, color.scheme = "RdYlBu",
alpha = 0.05, mult.corr = "fdr", sort.by = "fc",
detect.lim = 1e-06, pr.cutoff = 1e-6, max.show = 50,
plot.type = "quantile.box",
panels = c("fc", "auroc"), prompt = TRUE,
feature.type = 'filtered', paired=NULL, verbose = 1)
```

Arguments

- | | |
|---------------------------|--|
| <code>siamcat</code> | object of class siamcat-class |
| <code>fn.plot</code> | string, filename for the pdf-plot. If <code>fn.plot</code> is NULL, the plot will be produced in the active graphics device. |
| <code>color.scheme</code> | valid R color scheme or vector of valid R colors (must be of the same length as the number of classes), defaults to 'RdYlBu' |
| <code>alpha</code> | float, significance level, defaults to 0.05 |

mult.corr	string, multiple hypothesis correction method, see p.adjust , defaults to "fdr"
sort.by	string, sort features by p-value ("p.val"), by fold change ("fc") or by prevalence shift ("pr.shift"), defaults to "fc"
detect.lim	float, pseudocount to be added before log-transformation of the data, defaults to 1e-06. Will be ignored if feature.type is "normalized".
pr.cutoff	float, cutoff for the prevalence computation, defaults to 1e-06
max.show	integer, how many associated features should be shown, defaults to 50
plot.type	string, specify how the abundance should be plotted, must be one of these: c("bean", "box", "quantile.box", "quantile.rect"), defaults to "quantile.box"
panels	vector, name of the panels to be plotted next to the abundances, possible entries are c("fc", "auroc", "prevalence"), defaults to c("fc", "auroc")
prompt	boolean, turn on/off prompting user input when not plotting into a pdf-file, defaults to TRUE
feature.type	string, on which type of features should the function work? Can be either c() "original", "filtered", or "normalized"). Please only change this parameter if you know what you are doing! If feature.type is "normalized", the normalized abundances will not be log10-transformed.
paired	character, column name of the meta-variable containing information for a paired test
verbose	integer, control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1

Details

For each feature, this function calculates different measures of association between the feature and the label. In detail, these associations are:

- Significance as computed by a Wilcoxon test followed by multiple hypothesis testing correction.
- AUROC (Area Under the Receiver Operating Characteristics Curve) as a non-parameteric measure of enrichment (corresponds to the effect size of the Wilcoxon test).
- The generalized Fold Change (gFC) is a pseudo fold change which is calculated as geometric mean of the differences between the quantiles for the different classes found in the label.
- The prevalence shift between the two different classes found in the label.

Finally, the function produces a plot of the top max.show associated features at a user-specified significance level alpha, showing the distribution of the log10-transformed abundances for both classes, and user-selected panels for the effect (AU-ROC, Prevalence Shift, and Fold Change).

Value

object of class [siamcat-class](#) with the slot associations filled

Examples

```
# Example data
data(siamcat_example)

# Simple example
siamcat_example <- check.associations(siamcat_example,
fn.plot='./assoc_plot.pdf')

# Plot associations as box plot
siamcat_example <- check.associations(siamcat_example,
fn.plot='./assoc_plot_box.pdf', plot.type='box')

# Additionally, sort by p-value instead of by fold change
siamcat_example <- check.associations(siamcat_example,
fn.plot='./assoc_plot_fc.pdf', plot.type='box', sort.by='p.val')

# Custom colors
siamcat_example <- check.associations(siamcat_example,
fn.plot='./assoc_plot_blue_yellow.pdf', plot.type='box',
color.scheme=c('cornflowerblue', '#ffc125'))
```

check.confounders

Check for potential confounders in the metadata

Description

Checks potential confounders in the metadata and produces some visualizations

Usage

```
check.confounders(siamcat, fn.plot, meta.in = NULL,
feature.type='filtered', verbose = 1)
```

Arguments

<code>siamcat</code>	an object of class siamcat-class
<code>fn.plot</code>	string, filename for the pdf-plot
<code>meta.in</code>	vector, specific metadata variable names to analyze, defaults to NULL (all metadata variables will be analyzed)
<code>feature.type</code>	string, on which type of features should the function work? Can be either c()."original", "filtered", or "normalized"). Please only change this parameter if you know what you are doing!
<code>verbose</code>	integer, control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1

Details

This function checks for associations between class labels and potential confounders (e.g. Age, Sex, or BMI) that are present in the metadata. Statistical testing is performed with Fisher's exact test or Wilcoxon test, while associations are visualized either as barplot or Q-Q plot, depending on the type of metadata.

Additionally, it evaluates associations among metadata variables using conditional entropy and associations with the label using generalized linear models, producing a correlation heatmap and appropriate quantitative barplots, respectively.

Value

Does not return anything, but outputs plots to specified pdf file

Examples

```
# Example data
data(siamcat_example)

# Simple working example
check.confounders(siamcat_example, './conf_plot.pdf')
```

`create.data.split` *Split a dataset into training and a test sets.*

Description

This function prepares the cross-validation by splitting the data into `num.folds` training and test folds for `num.resample` times.

Usage

```
create.data.split(siamcat, num.folds = 2, num.resample = 1,
                  stratify = TRUE, inseparable = NULL, verbose = 1)
```

Arguments

<code>siamcat</code>	object of class <code>siamcat-class</code>
<code>num.folds</code>	integer number of cross-validation folds (needs to be ≥ 2), defaults to 2
<code>num.resample</code>	integer, resampling rounds (values ≤ 1 deactivate resampling), defaults to 1
<code>stratify</code>	boolean, should the splits be stratified so that an equal proportion of classes are present in each fold?, defaults to TRUE
<code>inseparable</code>	string, name of metadata variable to be inseparable, defaults to NULL, see Details below
<code>verbose</code>	integer, control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1

Details

This function splits the labels within a [siamcat-class](#) object and prepares the internal cross-validation for the model training (see [train.model](#)).

The function saves the training and test instances for the different cross-validation folds within a list in the `data_split`-slot of the [siamcat-class](#) object, which is a list with four entries:

- `num.folds` - the number of cross-validation folds
- `num.resample` - the number of repetitions for the cross-validation
- `training.folds` - a list containing the indices for the training instances
- `test.folds` - a list containing the indices for the test instances

If provided, the data split will take into account a metadata variable for the data split (by providing the `inseparable` argument). For example, if the data contains several samples for the same individual, it would make sense to keep data from the same individual within the same fold. If `inseparable` is given, the `stratify` argument will be ignored.

Value

object of class [siamcat-class](#) with the `data_split`-slot filled

Examples

```
data(siamcat_example)

# simple working example
siamcat_split <- create.data.split(siamcat_example,
  num.folds=10,
  num.resample=5,
  stratify=TRUE)
```

create.label

Create a label list

Description

This function creates a label object from metadata or an atomic vector

Usage

```
create.label(label, case,
  meta=NULL, control=NULL,
  p.lab = NULL, n.lab = NULL,
  remove.meta.column=FALSE,
  verbose=1)
```

Arguments

label	named vector to create the label or the name of the metadata column that will be used to create the label
case	name of the group that will be used as a positive label. If the variable is binary, the other label will be used as a negative one. If the variable has multiple values, all the other values will be used a negative label (testing one vs rest).
meta	metadata dataframe object or an object of class sample_data-class
control	name of a label or vector with names that will be used as a negative label. All values that are nor equal to case and control will be dropped. Default to NULL in which case: If the variable is binary, the value not equal to case will be used as negative. If the variable has multiple values, all the values not equal to cases will be used a negative label (testing one vs rest).
p.lab	name of the positive group (useful mostly for visualizations). Default to NULL in which case the value of the positive group will be used.
n.lab	name of the negative group (useful mostly for visualizations). Default to NULL in which case the value of the negative group will be used for binary variables and "rest" will be used for variables with multiple values.
remove.meta.column	boolean indicating if the label column in the metadata should be retained. Please note that if this is set to TRUE, the function will return a list as result. Defaults to FALSE
verbose	integer, control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1

Details

The function creates a list to be used as label in a SIAMCAT object. Mainly for interal use, but it can be used to customize your label (p.lab and n.lab will be used as labels during plotting, for example).

The input for the function can be either a named vector encoding the label or the name of a column in the metadata (needs to be provided as well) which contains the label information.

Value

return either

- a list to be used in a SIMCAT object **OR**
- a list with entries meta and label, if remove.meta.column is set to TRUE

Examples

```
data('meta_crc_zeller')

label <- create.label(label='Group', case='CRC', meta=meta_crc_zeller)
```

data_split*Retrieve the data split from a SIAMCAT object***Description**

Function to retrieve the data split stored in the `data_split` slot within a SIAMCAT object

Usage

```
data_split(siamcat, verbose=1)

## S4 method for signature 'siamcat'
data_split(siamcat, verbose = 1)
```

Arguments

<code>siamcat</code>	(Required). An instance of siamcat-class containing a data split
<code>verbose</code>	integer, if the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message)

Details

The function returns a list containing information about the data split. See [create.data.split](#) for more details.

Value

A list containing the data split information or NULL

Examples

```
data(siamcat_example)
temp <- data_split(siamcat_example)
names(temp)
```

data_split<-*Assign a new list containing a cross-validation split to a SIAMCAT object***Description**

Assign a new list containing a cross-validation split to a SIAMCAT object

Usage

```
data_split(x) <- value

## S4 replacement method for signature 'siamcat,list'
data_split(x) <- value
```

Arguments

x	an object of class siamcat-class
value	list containing a cross-validation split

Value

none

Examples

```
data(siamcat_example)
data_split(siamcat_example) <- data_split(siamcat_example)
```

evaluate.predictions *Evaluate prediction results*

Description

This function takes the correct labels and predictions for all samples and evaluates the results using the

- Area Under the Receiver Operating Characteristic (ROC) Curve (AU-ROC)
- and the Precision-Recall Curve (PR)

as metric. Predictions can be supplied either for a single case or as matrix after resampling of the dataset.

Prediction results are usually produced with the function [make.predictions](#).

Usage

```
evaluate.predictions(siamcat, verbose = 1)
```

Arguments

siamcat	object of class siamcat-class
verbose	integer, control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1

Details

This function calculates several metrics for the predictions in the pred_matrix-slot of the **siamcat-class**-object. The Area Under the Receiver Operating Characteristic (ROC) Curve (AU-ROC) and the Precision-Recall Curve will be evaluated and the results will be saved in the eval_data-slot of the supplied **siamcat-class**-object. The eval_data-slot contains a list with several entries:

- \$roc - average ROC-curve across repeats or a single ROC-curve on complete dataset (see [roc](#));
- \$auroc - AUC value for the average ROC-curve;
- \$prc - list containing the positive predictive value (precision) and true positive rate (recall) values used to plot the mean PR curve;
- \$auprc - AUC value for the mean PR curve;
- \$ev - list containing for different decision thresholds the number of false positives, false negatives, true negatives, and true positives.

For the case of repeated cross-validation, the function will additionally return

- \$roc.all - list of roc objects (see [roc](#)) for every repeat;
- \$auroc.all - vector of AUC values for the ROC curves for every repeat;
- \$prc.all - list of PR curves for every repeat;
- \$auprc.all - vector of AUC values for the PR curves for every repeat;
- \$ev.all - list of ev lists (see above) for every repeat.

Value

object of class **siamcat-class** with the slot eval_data filled

Examples

```
data(siamcat_example)
siamcat_evaluated <- evaluate.predictions(siamcat_example)
```

eval_data

Retrieve the evaluation metrics from a SIAMCAT object

Description

Function to retrieve the evaluation metrics from a SIAMCAT object

Usage

```
eval_data(siamcat, verbose=1)

## S4 method for signature 'siamcat'
eval_data(siamcat, verbose = 1)
```

Arguments

- siamcat (Required). A [siamcat-class](#) object that contains evaluation data
 verbose integer, if the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message)

Details

The functions returns a list containing the evaluation metrics from a SIAMCAT object. See [evaluate.predictions](#) for more information on evaluation data.

Value

The list of evaluation data or NULL

Examples

```
data(siamcat_example)
temp <- eval_data(siamcat_example)
names(temp)
temp$auroc
```

eval_data<-

Assign a new list with evaluation data to a SIAMCAT object

Description

Assign a new list with evaluation data to a SIAMCAT object

Usage

```
eval_data(x) <- value

## S4 replacement method for signature 'siamcat,list'
eval_data(x) <- value
```

Arguments

- x an object of class [siamcat-class](#)
 value a list of evaluation data

Value

none

Examples

```
data(siamcat_example)
eval_data(siamcat_example) <- eval_data(siamcat_example)
```

`feat.crc.zeller` *Example feature matrix*

Description

Feature matrix (as data.frame) of the CRC dataset from Zeller et al. MSB 2014 (see <http://msb.embopress.org/content/10/11/766>), containing 141 samples and 1754 bacterial species (features).

Source

<http://msb.embopress.org/content/10/11/766>

`feature_type` *Retrieve the feature type used for model training from a SIAMCAT object*

Description

Function to retrieve information on which type of features the models were trained

Usage

```
feature_type(siamcat, verbose=1)

## S4 method for signature 'siamcat'
feature_type(siamcat, verbose = 1)
```

Arguments

<code>siamcat</code>	(Required). An instance of siamcat-class that contains trained models
<code>verbose</code>	integer, if the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message)

Details

The function extracts the information on which type of features the models were trained.

Value

The string describing type of feature used for the model training or NULL

Examples

```
data(siamcat_example)
feature_type(siamcat_example)
```

feature_weights	<i>Retrieve the matrix of feature weights from a SIAMCAT object</i>
-----------------	---

Description

Function to extract the feature weights from a SIAMCAT object

Usage

```
feature_weights(siamcat, verbose=1)

## S4 method for signature 'siamcat'
feature_weights(siamcat, verbose = 1)
```

Arguments

siamcat	(Required). A siamcat-class object that contains trained models
verbose	integer, if the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message)

Details

The function extracts the weight matrix from all trained models (see [weight_matrix](#)) and computes several metrics on the feature weights:

- mean.weight - mean weight across trained models
- median.weight - median weight across trained models
- sd.weight - standard deviation of the weight across trained models
- mean.rel.weight - mean **relative** weight across trained models (each model is normalized by the absolute of all weights)
- median.rel.weight - median **relative** weight across trained models
- sd.rel.weight - standard deviation of the **relative** weight across trained models
- percentage - percentage of models in which this feature was selected (i.e. non-zero)

Value

A dataframe containing mean/median feature weight and additional info or NULL

Examples

```
data(siamcat_example)
temp <- feature_weights(siamcat_example)
head(temp)
```

filter.features *Perform unsupervised feature filtering.*

Description

This function performs unsupervised feature filtering. Features can be filtered based on abundance, prevalence, or on variance. Additionally, unmapped reads may be removed.

Usage

```
filter.features(siamcat, filter.method = "abundance",
               cutoff = 0.001, rm.unmapped = TRUE,
               feature.type='original', verbose = 1)
```

Arguments

<code>siamcat</code>	an object of class siamcat-class
<code>filter.method</code>	string, method used for filtering the features, can be one of these: <code>c('abundance', 'cum.abundance', 'prevalence')</code> . Defaults to 'abundance'
<code>cutoff</code>	float, abundance, prevalence, or variance cutoff, defaults to <code>0.001</code> (see Details below)
<code>rm.unmapped</code>	boolean, should unmapped reads be discarded?, defaults to <code>TRUE</code>
<code>feature.type</code>	string, on which type of features should the function work? Can be either "original", "filtered", or "normalized". Please only change this parameter if you know what you are doing!
<code>verbose</code>	integer, control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1

Details

This function filters the features in a [siamcat-class](#) object in a unsupervised manner.

The different filter methods work in the following way:

- 'abundance' - remove features whose maximum abundance is never above the threshold value in any of the samples
- 'cum.abundance' - remove features with very low abundance in all samples, i.e. those that are never among the most abundant entities that collectively make up $(1-\text{cutoff})$ of the reads in any sample
- 'prevalence' - remove features with low prevalence across samples, i.e. those that are undetected (relative abundance of 0) in more than $1 - \text{cutoff}$ percent of samples.
- 'variance' - remove features with low variance across samples, i.e. those that have a variance lower than cutoff
- 'pass' - pass-through filtering will not change the features

Features can also be filtered repeatedly with different methods, e.g. first using the maximum abundance filtering and then using prevalence filtering. However, if a filtering method has already been applied to the dataset, SIAMCAT will default back on the original features for filtering.

Value

siamcat an object of class [siamcat-class](#)

Examples

```
# Example dataset
data(siamcat_example)

# Simple examples
siamcat_filtered <- filter.features(siamcat_example,
  filter.method='abundance',
  cutoff=1e-03)

# 5% prevalence filtering
siamcat_filtered <- filter.features(siamcat_example,
  filter.method='prevalence',
  cutoff=0.05)
```

`filter.label`

Filter the label of a SIMACAT object

Description

This function filters the label in a SIAMCAT object

Usage

```
filter.label(siamcat, ids, verbose = 1)
```

Arguments

<code>siamcat</code>	an object of class siamcat-class
<code>ids</code>	vector, can contain either names or indices of samples to be retained
<code>verbose</code>	integer, control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1

Details

This function filters the label contained in a SIAMCAT object, based on the provided `ids`. The IDs can be either sample names or indices to be retained.

Predominantly for internal use...

Please note: It makes sense to run [validate.data](#) after filtering the label.

Value

siamcat an object of class [siamcat-class](#)

Examples

```
data(siamcat_example)

# simple working example
siamcat_filtered <- filter.label(siamcat_example, ids=c(1:20))
```

filt_feat

Retrieve the information stored in the filt_feat slot within a SIAM-CAT object

Description

Function to retrieve the information stored in the `filt_feat` slot within a SIAMCAT object

Usage

```
filt_feat(siamcat, verbose=1)

## S4 method for signature 'siamcat'
filt_feat(siamcat, verbose = 1)
```

Arguments

<code>siamcat</code>	(Required). An instance of siamcat-class that contains filtered features
<code>verbose</code>	integer, if the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message)

Details

The function will return a list containing the information stored in the `filt_feat` slot of a SIAMCAT object. This list contains:

- `filt.feat` - filtered features as matrix, see [get.filt_feat.matrix](#)
- `filt.param` - parameters used for feature filtering, see [get.filt_feat.matrix](#)

Value

The list stored in the `filt_feat` slot of the SIAMCAT object or NULL

Examples

```
data(siamcat_example)
temp <- filt_feat(siamcat_example)
names(temp)
```

filt_feat<-	<i>Assign a new filt_feat object to x</i>
-------------	---

Description

Assign a new filt_feat object to x

Usage

```
 filt_feat(x) <- value  
## S4 replacement method for signature 'siamcat,list'  
filt_feat(x) <- value
```

Arguments

x	an object of class siamcat-class
value	an filt_feat object

Value

none

Examples

```
data(siamcat_example)  
filt_feat(siamcat_example) <- list(  
  filt.feat=filt_feat(siamcat_example),  
  filt.param=filt_params(siamcat_example))
```

filt_params	<i>Retrieve the list of parameters for feature filtering from a SIAMCAT object</i>
-------------	--

Description

Function to retrieve the list of parameters for feature filtering

Usage

```
 filt_params(siamcat, verbose=1)  
## S4 method for signature 'siamcat'  
filt_params(siamcat, verbose = 1)
```

Arguments

- `siamcat` (Required). An instance of [siamcat-class](#) containing filtered features
`verbose` integer, if the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message)

Details

The function returns the list of feature filtering parameters. See [filter.features](#) for more details.

Value

A list of feature filtering parameters or NULL

Examples

```
data(siamcat_example)
temp <- filt_params(siamcat_example)
names(temp)
```

`get.filt_feat.matrix` *Retrieve the filtered features from a SIAMCAT object*

Description

Function to retrieve the filtered features from a SIAMCAT object

Usage

```
get.filt_feat.matrix(siamcat)
```

Arguments

- `siamcat` (Required). An instance of [siamcat-class](#) containing filtered features

Details

The function returns the filtered features as matrix. See [filter.features](#) for more details.

Value

A matrix containing the filtered features

Examples

```
data(siamcat_example)
feat.filt <- get.filt_feat.matrix(siamcat_example)
feat.filt[1:3, 1:3]
```

get.norm_feat.matrix *Retrieve the normalized features from a SIAMCAT object*

Description

Function to retrieve the normalized features from a SIAMCAT object

Usage

```
get.norm_feat.matrix(siamcat)
```

Arguments

siamcat (Required). An instance of [siamcat-class](#) containing normalized features

Details

The function returns the normalized features as matrix. See [normalize.features](#) for more details.

Value

A matrix containing the normalized features

Examples

```
data(siamcat_example)
feat.norm <- get.norm_feat.matrix(siamcat_example)
feat.norm[1:3, 1:3]
```

get.orig_feat.matrix *Retrieve the original features from a SIAMCAT object*

Description

Function to retrieve the original features from a SIAMCAT object

Usage

```
get.orig_feat.matrix(siamcat)
```

Arguments

siamcat (Required). An instance of [siamcat-class](#)

Details

The function returns the original features as matrix.

Value

A matrix containing the original features

Examples

```
data(siamcat_example)
feat.original <- get.orig_feat.matrix(siamcat_example)
feat.original[1:3, 1:3]
```

label

Retrieve the label from a SIAMCAT object

Description

Retrieve the label from a SIAMCAT object

Usage

```
label(siamcat, verbose=1)

## S4 method for signature 'siamcat'
label(siamcat, verbose = 1)
```

Arguments

siamcat	(Required). A siamcat-class object
verbose	integer, if the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message)

Details

This function will retrieve the label information from a SIAMCAT object. The label will contain three entries:

- **label**: The label as named vector, in which the classes are encoded numerically
- **info**: Information about the different classes
- **type**: What kind of label is it?

Value

The label or NULL.

Examples

```
data(siamcat_example)
temp <- label(siamcat_example)
head(temp$label)
temp$info
temp$type
```

label<-	<i>Assign a new label object to a SIAMCAT object</i>
---------	--

Description

Assign a new label object to a SIAMCAT object

Usage

```
label(x) <- value  
  
## S4 replacement method for signature 'siamcat,list'  
label(x) <- value
```

Arguments

x	an object of class siamcat-class
value	an list (in label format)

Value

none

Examples

```
data(siamcat_example)  
label(siamcat_example) <- label(siamcat_example)
```

make.predictions	<i>Make predictions on a test set</i>
------------------	---------------------------------------

Description

This function takes a [siamcat-class](#)-object containing a model trained by [train.model](#) and performs predictions on a given test-set.

Usage

```
make.predictions(siamcat, siamcat.holdout = NULL,  
normalize.holdout = TRUE, verbose = 1)
```

Arguments

<code>siamcat</code>	object of class siamcat-class
<code>siamcat.holdout</code>	optional, object of class siamcat-class on which to make predictions, defaults to <code>NULL</code>
<code>normalize.holdout</code>	boolean, should the holdout features be normalized with a frozen normalization (see normalize.features) using the normalization parameters in <code>siamcat?</code> , defaults to <code>TRUE</code>
<code>verbose</code>	integer, control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1

Details

This function uses the model in the `model_list`-slot of the `siamcat` object to make predictions on a given test set. The test set can either consist of the test instances in the cross-validation, saved in the `data_split`-slot of the same `siamcat` object, or a completely external feature set, given in the form of another `siamcat` object (`siamcat.holdout`).

Value

object of class [siamcat-class](#) with the slot `pred_matrix` filled

Examples

```
data(siamcat_example)

# Simple example
siamcat.pred <- make.predictions(siamcat_example)

# Predictions on a holdout-set
pred.mat <- make.predictions(siamcat.trained, siamcat.holdout,
                             normalize.holdout=TRUE)
```

Description

Retrieve the metadata from a SIAMCAT object

Usage

```
meta(siamcat)

## S4 method for signature 'siamcat'
meta(siamcat)

## S4 method for signature 'sample_data'
meta(siamcat)
```

Arguments

siamcat (Required). A [siamcat-class](#) object

Details

This function will retrieve the metadata from a SIAMCAT object. The metadata is a object of the [sample_data-class](#).

Value

The metadata as [sample_data-class](#) object

Examples

```
data(siamcat_example)
temp <- meta(siamcat_example)
head(temp)
```

meta.crc.zeller *Example metadata matrix*

Description

Metadata (as data.frame) of the CRC dataset from Zeller et al. MSB 2014 (see <http://msb.embopress.org/content/10/11/766>), containing 6 metadata variables (e.g. Age or BMI) for 141 samples.

Source

<http://msb.embopress.org/content/10/11/766>

`meta<-` *Assign a new sam_data object to x*

Description

Assign a new sam_data object to x

Usage

```
meta(x) <- value

## S4 replacement method for signature 'siamcat,sample_data'
meta(x) <- value
```

Arguments

<code>x</code>	an object of class siamcat-class
<code>value</code>	an object of class sample_data-class

Value

none

Examples

```
data(siamcat_example)
meta(siamcat_example) <- meta(siamcat_example)
```

`model.evaluation.plot` *Model Evaluation Plot*

Description

Produces two plots for model evaluation. The first plot shows the Receiver Operating Characteristic (ROC)-curves, the other the Precision-recall (PR)-curves for the different cross-validation repetitions.

Usage

```
model.evaluation.plot(..., fn.plot = NULL,
                     colours=NULL, show.all=FALSE, verbose = 1)
```

Arguments

...	one or more object of class siamcat-class , can be named
fn.plot	string, filename for the pdf-plot
colours	colour specification for the different siamcat-class - objects, defaults to NULL which will cause the colours to be picked from the 'Set1' palette
show.all	boolean, Should all repeated cross-validation models be plotted?
verbose	control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1

Value

Does not return anything, but produces the model evaluation plot.

Examples

```
data(siamcat_example)

# simple working example
model.evaluation.plot(siamcat_example, fn.plot='./eval.pdf')

# plot several named SIAMCAT object
# (although we use only one example object here)
model.evaluation.plot('Example_1'=siamcat_example,
                      'Example_2'=siamcat_example, colours=c('red', 'blue'),
                      fn.plot='./eval.pdf')
```

model.interpretation.plot
Model Interpretation Plot

Description

This function produces a plot for model interpretation, displaying

- the feature weights,
- the robustness of feature weights
- the features scores across samples,
- the distribution of metadata across samples, and
- the proportion of model weights shown.

Usage

```
model.interpretation.plot(siamcat, fn.plot = NULL,
  color.scheme = "BrBG",
  consens.thres = 0.5,
  heatmap.type = "zscore",
  limits = c(-3, 3), detect.lim = 1e-06,
  max.show = 50, prompt=TRUE, verbose = 1)
```

Arguments

<code>siamcat</code>	object of class <code>siamcat-class</code>
<code>fn.plot</code>	string, filename for the pdf-plot
<code>color.scheme</code>	color scheme for the heatmap, defaults to 'BrBG'
<code>consens.thres</code>	float, minimal ratio of models incorporating a feature in order to include it into the heatmap, defaults to 0.5 Note that for 'randomForest' models, this cutoff specifies the minimum median Gini coefficient for a feature to be included and should therefore be much lower, e.g. 0.01
<code>heatmap.type</code>	string, type of the heatmap, can be either 'fc' or 'zscore', defaults to 'zscore'
<code>limits</code>	vector, cutoff for extreme values in the heatmap, defaults to <code>c(-3, 3)</code>
<code>detect.lim</code>	float, pseudocount to be added before log-transformation of features, defaults to <code>1e-06</code>
<code>max.show</code>	integer, maximum number of features to be shown in the model interpretation plot, defaults to 50
<code>prompt</code>	boolean, turn on/off prompting user input when not plotting into a pdf-file, defaults to TRUE
<code>verbose</code>	control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1

Details

Produces a plot consisting of

- a barplot showing the feature weights and their robustness (i.e. in what proportion of models have they been incorporated)
- a heatmap showing the z-scores of the metagenomic features across patients
- another heatmap displaying the metadata categories (if applicable)
- a boxplot displaying the proportion of weight per model that is actually shown for the features that are incorporated into more than `consens.thres` percent of the models.

Value

Does not return anything, but produces the model interpretation plot.

Examples

```
data(siamcat_example)

# simple working example
model.interpretation.plot(siamcat_example, fn.plot='./interpretion.pdf',
  heatmap.type='zscore')
```

models

Retrieve list of trained models from a SIAMCAT object

Description

Function to retrieve the list of trained models

Usage

```
models(siamcat, verbose=1)

## S4 method for signature 'siamcat'
models(siamcat, verbose = 1)
```

Arguments

siamcat	(Required). An instance of siamcat-class that contains trained models
verbose	integer, if the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message)

Details

The function extracts the list of trained models.

Value

The list of models or NULL

Examples

```
data(siamcat_example)
temp <- models(siamcat_example)
temp[[1]]
```

model_list	<i>Retrieve the information stored in the model_list slot within a SIAM-CAT object</i>
-------------------	--

Description

Function to retrieve the information stored in the `model_list` slot within a SIAMCAT object

Usage

```
model_list(siamcat, verbose=1)

## S4 method for signature 'siamcat'
model_list(siamcat, verbose = 1)
```

Arguments

- | | |
|----------------------|---|
| <code>siamcat</code> | (Required). An instance of siamcat-class that contains trained models |
| <code>verbose</code> | integer, if the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message) |

Details

The function will return a list containing the information stored in the `model_list` slot of a SIAMCAT object. This list contains:

- `models` - list of trained models
- `model_type` - machine learning method used for training
- `feature_type` - string describing on which type of features the models were trained

Value

The list stored in the `model_list` slot of the SIAMCAT object or NULL

Examples

```
data(siamcat_example)
temp <- model_list(siamcat_example)
names(temp)
```

```
model_list<-
```

Assign a new list containing trained models to a SIAMCAT object

Description

Assign a new list containing trained models to a SIAMCAT object

Usage

```
model_list(x) <- value  
  
## S4 replacement method for signature 'siamcat,list'  
model_list(x) <- value
```

Arguments

x	an object of class siamcat-class
value	list containing trained models, type of models and of features

Value

none

Examples

```
data(siamcat_example)  
model_list(siamcat_example) <- model_list(siamcat_example)
```

```
model_type
```

Retrieve the machine learning method from a SIAMCAT object

Description

Function to retrieve information on which type of machine learning method was used for model training

Usage

```
model_type(siamcat, verbose=1)  
  
## S4 method for signature 'siamcat'  
model_type(siamcat, verbose = 1)
```

Arguments

siamcat	(Required). An instance of siamcat-class that contains trained models
verbose	integer, if the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message)

Details

The function extracts the information on which type of machine learning method was used for model training.

Value

The string describing the machine learning method or NULL

Examples

```
data(siamcat_example)
model_type(siamcat_example)
```

normalize.features *Perform feature normalization*

Description

This function performs feature normalization according to user- specified parameters.

Usage

```
normalize.features(siamcat,
  norm.method = c("rank.unit", "rank.std",
    "log.std", "log.unit", "log.clr", "std", "pass"),
  norm.param = list(log.n0 = 1e-06, sd.min.q = 0.1,
    n.p = 2, norm.margin = 1),
  feature.type='filtered',
  verbose = 1)
```

Arguments

siamcat	an object of class siamcat-class
norm.method	string, normalization method, can be one of these: 'c('rank.unit','rank.std','log.std','log.uni
norm.param	list, specifying the parameters of the different normalization methods, see details for more information
feature.type	string, on which type of features should the function work? Can be either "original", "filtered", or "normalized". Please only change this parameter if you know what you are doing!
verbose	integer, control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1

Details

There are seven different normalization methods available:

- 'rank.unit' - converts features to ranks and normalizes each column (=sample) by the square root of the sum of ranks
- 'rank.std' - converts features to ranks and applies z-score standardization
- 'log.clr' - centered log-ratio transformation (with the addition of pseudocounts)
- 'log.std' - log-transforms features (after addition of pseudocounts) and applies z-score standardization
- 'log.unit' - log-transforms features (after addition of pseudocounts) and normalizes by features or samples with different norms
- 'std' - z-score standardization without any other transformation
- 'pass' - pass-through normalization will not change the features

The list entries in 'norm.param' specify the normalization parameters, which are dependant on the normalization method of choice:

- 'rank.unit' or 'pass' does not require any other parameters
- 'rank.std' and 'std' requires `sd.min.q`, quantile of the distribution of standard deviations of all features that will be added to the denominator during standardization in order to avoid underestimation of the standard deviation, defaults to 0.1
- 'log.clr' requires `log.n0`, which is the pseudocount to be added before log-transformation, defaults to NULL leading to the estimation of `log.n0` from the data
- 'log.std' requires both `log.n0` and `sd.min.q`, using the same default values
- 'log.unit' requires next to `log.n0` also the parameters `n.p` and `norm.margin`. `n.p` specifies the vector norm to be used, can be either 1 for $x/\sum(x)$ or 2 for $x/\sqrt{\sum(x^2)}$. The parameter `norm.margin` specifies the margin over which to normalize, similarly to the `apply`-syntax: Allowed values are 1 for normalization over features, 2 over samples, and 3 for normalization by the global maximum.

The function additionally allows to perform a frozen normalization on a different dataset. After normalizing the first dataset, the `norm_feat` slot in the `siamcat` object contains all parameters of the normalization, which you can access via the `norm_params` accessor.

In order to perform a frozen normalization of a new dataset, you can run the function supplying the normalization parameters as argument to `norm.param`: `norm.param=norm_params(siamcat_reference)`. See also the example below.

Value

an object of class `siamcat-class` with normalized features

Examples

```
# Example data
data(siamcat_example)

# Simple example
```

```

siamcat_norm <- normalize.features(siamcat_example,
    norm.method='rank.unit')

# log.unit example
siamcat_norm <- normalize.features(siamcat_example,
    norm.method='log.unit',
    norm.param=list(log.n0=1e-05, n.p=1, norm.margin=1))

# log.std example
siamcat_norm <- normalize.features(siamcat_example,
    norm.method='log.std',
    norm.param=list(log.n0=1e-05, sd.min.q=.1))

# Frozen normalization
siamcat_norm <- normalize.features(siamcat,
    norm.param=norm_params(siamcat_reference))

```

norm_feat

Retrieve the information stored in the norm_feat slot within a SIAM-CAT object

Description

Function to retrieve the information stored in the norm_feat slot within a SIAMCAT object

Usage

```

norm_feat(siamcat, verbose=1)

## S4 method for signature 'siamcat'
norm_feat(siamcat, verbose = 1)

```

Arguments

siamcat	(Required). An instance of siamcat-class that contains normalized features
verbose	integer, if the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message)

Details

The function will return a list containing the information stored in the norm_feat slot of a SIAM-CAT object. This list contains:

- norm.feat - normalized features as matrix, see [get.norm_feat.matrix](#)
- norm.param - parameters used for normalization, see [normalize.features](#)

Value

The list stored in the norm_feat slot of the SIAMCAT object or NULL

Examples

```
data(siamcat_example)
temp <- norm_feat(siamcat_example)
names(temp)
```

norm_feat<-

Assign a new list containing normalization parameters and normalized features to a SIAMCAT object

Description

Assign a new list containing normalization parameters and normalized features to a SIAMCAT object

Usage

```
norm_feat(x) <- value

## S4 replacement method for signature 'siamcat,list'
norm_feat(x) <- value
```

Arguments

x	an object of class siamcat-class
value	a list containing normalization parameters and features

Value

none

Examples

```
data(siamcat_example)
norm_feat(siamcat_example) <- norm_feat(siamcat_example)
```

norm_params

Retrieve the list of parameters for feature normalization from a SIAMCAT object

Description

Function to retrieve the list of parameters for feature normalization

Usage

```
norm_params(siamcat, verbose=1)

## S4 method for signature 'siamcat'
norm_params(siamcat, verbose = 1)
```

Arguments

- siamcat** (Required). An instance of [siamcat-class](#) containing normalized features
verbose integer, if the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message)

Details

The function returns the list of normalization parameters used in the feature normalization procedure. See [normalize.features](#) for more details.

Value

A list of normalization parameters or NULL

Examples

```
data(siamcat_example)
temp <- norm_params(siamcat_example)
names(temp)
```

orig_feat

Retrieve a [otu_table-class](#) object from otu_table slot in the phyloseq slot in a siamcat object

Description

Retrieve a [otu_table-class](#) object from otu_table slot in the phyloseq slot in a siamcat object

Usage

```
orig_feat(siamcat)

## S4 method for signature 'siamcat'
orig_feat(siamcat)

## S4 method for signature 'otu_table'
orig_feat(siamcat)
```

Arguments

siamcat (Required). An instance of [siamcat-class](#) that contains a label or instance of [otu_table-class](#).

Value

The [otu_table-class](#) object or NULL.

Examples

```
data(siamcat_example)
temp <- orig_feat(siamcat_example)
```

orig_feat<-

Assign a new otu_table object to x orig_feat slot

Description

Assign a new otu_table object to x orig_feat slot

Usage

```
orig_feat(x) <- value

## S4 replacement method for signature 'siamcat,otu_table'
orig_feat(x) <- value
```

Arguments

x an object of class [siamcat-class](#)
value an object of class [otu_table-class](#)

Value

none

Examples

```
data(siamcat_example)
orig_feat(siamcat_example) <- orig_feat(siamcat_example)
```

physeq*Retrieve a phyloseq-class object from object.***Description**

Retrieve a [phyloseq-class](#) object from object.

Usage

```
physeq(siamcat, verbose=1)

## S4 method for signature 'ANY'
physeq(siamcat, verbose = 1)

## S4 method for signature 'phyloseq'
physeq(siamcat)
```

Arguments

siamcat	(Required). An instance of siamcat-class that contains a label or instance of phyloseq-class .
verbose	If the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message)

Value

The [phyloseq-class](#) object or NULL.

Examples

```
data(siamcat_example)
physeq(siamcat_example)
```

physeq<-*Assign a new phyloseq object to x***Description**

Assign a new phyloseq object to x

Usage

```
physeq(x) <- value

## S4 replacement method for signature 'siamcat,phyloseq'
physeq(x) <- value
```

Arguments

x	an object of class siamcat-class
value	an object of class phyloseq-class

Value

none

Examples

```
data(siamcat_example)
physeq(siamcat_example) <- physeq(siamcat_example)
```

pred_matrix

*Retrieve the prediction matrix from a SIAMCAT object***Description**

Function to retrieve the prediction matrix from a SIAMCAT object

Usage

```
pred_matrix(siamcat, verbose=1)

## S4 method for signature 'siamcat'
pred_matrix(siamcat, verbose = 1)
```

Arguments

siamcat	(Required). A siamcat-class object that contains a prediction matrix
verbose	integer, if the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message)

Details

The functions returns a matrix containing the predictions for all samples across the different cross-validation repeats. See [make.predictions](#) for more information.

Value

A matrix containing predictions or NULL

Examples

```
data(siamcat_example)
temp <- pred_matrix(siamcat_example)
head(temp)
```

`pred_matrix<-` *Assign a new matrix with predictions to a SIAMCAT object*

Description

Assign a new matrix with predictions to a SIAMCAT object

Usage

```
pred_matrix(x) <- value

## S4 replacement method for signature 'siamcat,matrix'
pred_matrix(x) <- value
```

Arguments

<code>x</code>	an object of class siamcat-class
<code>value</code>	a matrix containing predictions

Value

`none`

Examples

```
data(siamcat_example)
pred_matrix(siamcat_example) <- pred_matrix(siamcat_example)
```

`read.label` *Read label file*

Description

Read label information from a file

Usage

```
read.label(fn.in.label)
```

Arguments

<code>fn.in.label</code>	name of the tsv file containing labels
--------------------------	--

Details

This function reads in a tsv file with labels and converts it into a label.

First row is expected to be

```
#BINARY:1=[label for cases]; -1=[label for controls].
```

Second row should contain the sample identifiers as tab-separated list (consistent with feature and metadata).

Third row is expected to contain the actual class labels (tab-separated): 1 for each case and -1 for each control.

Note: Labels can take other numeric values (but not characters or strings); importantly, the label for cases has to be greater than the one for controls

Value

label object containing several entries:

- \$label named vector containing the numerical labels from the file;
- \$info information about the classes in the label;
- \$type information about the label type (e.g. BINARY);

Examples

```
# run with example data
fn.label <- system.file('extdata',
  'label_crc_zeller_msb_mocat_specI.tsv',
  package = 'SIAMCAT')

crc.zeller.label <- read.label(fn.label)
```

read.lefse

read an input file in a LEfSe input format

Description

This reads an input file in a LEfSe input format

Usage

```
read.lefse(filename = "data.txt", rows.meta = 1, row.samples = 2)
```

Arguments

filename	name of the input file in a LEfSe input format
rows.meta	specifies in which rows medata variables are stored
row.samples	specifies in which row sample names are stored

Value

a list with two elements:

- `feat` a features matrix
- `meta` a metadate matrix

Examples

```
fn.in.lefse<- system.file("extdata",
  "LEFSe_crc_zeller_msb_mocat_specI.tsv", package = "SIAMCAT")
meta.and.features <- read.lefse(fn.in.lefse, rows.meta = 1:6,
  row.samples = 7)
meta <- meta.and.features$meta
feat <- meta.and.features$feat
label <- create.label(meta=meta, label="label", case = "cancer")
siamcat <- siamcat(feat=feat, label=label, meta=meta)
```

select.samples*Select samples based on metadata*

Description

This function select samples based on information given in the metadata

Usage

```
select.samples(siamcat, filter, allowed.set = NULL,
  allowed.range = NULL, verbose = 1)
```

Arguments

<code>siamcat</code>	an object of class siamcat-class
<code>filter</code>	string, name of the meta variable on which the selection should be done
<code>allowed.set</code>	a vector of allowed values
<code>allowed.range</code>	a range of allowed values
<code>verbose</code>	integer, control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1

Details

This functions selects labels and metadata based on a specific column in the metadata. Provided with a column-name in the metadata and a range or a set of allowed values, the function will filter the [siamcat-class](#) object accordingly.

Value

an object of class [siamcat-class](#) with labels and metadata filtered in order to contain only allowed values

Examples

```
data(siamcat_example)

# Select all samples that fall into an Age-range between 25 and 80 years
siamcat_selected <- select.samples(siamcat_example,
  filter='Age',
  allowed.range=c(25, 80))

# Select only female samples
siamcat_female <- select.samples(siamcat_example,
  filter='Gender',
  allowed.set=c('F'))
```

siamcat

SIAMCAT constructor function

Description

Function to construct an object of class [siamcat-class](#)

Usage

```
siamcat(..., feat=NULL, label=NULL, meta=NULL,
phyloseq=NULL, validate=TRUE, verbose=3)
```

Arguments

...	additional arguments
feat	feature information for SIAMCAT (see details)
label	label information for SIAMCAT (see details)
meta	(optional) metadata information for SIAMCAT (see details)
phyloseq	(optional) a phyloseq object for the creation of an SIAMCAT object (see details)
validate	boolean, should the newly constructed SIAMCAT object be validated? defaults to TRUE (we strongly recommend against setting this parameter to FALSE)
verbose	control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1

Details

Build siamcat-class objects from their components.

This functions creates a SIAMCAT object (see [siamcat-class](#)). In order to do so, the function needs

- `feat` the feature information for SIAMCAT, should be either a matrix, a data.frame, or a [otu_table-class](#). The columns should correspond to the different samples (e.g. patients) and the rows the different features (e.g. taxa). Columns and rows should be named.
- `meta` metadata information for the different samples in the feature matrix. Metadata is optional for the SIAMCAT workflow. Should be either a data.frame (with the rownames corresponding to the sample names of the feature matrix) or an object of class [sample_data-class](#)
- `phyloseq` Alternatively to supplying both `feat` and `meta`, SIAMCAT can also work with a phyloseq object containing an `otu_table` and other optional slots (like `sample_data` for meta-variables).

Notice: do supply **either** the feature information as matrix/data.frame/otu_table (and optionally metadata) **or** a phyloseq object, but not both.

The label information for SIAMCAT can take several forms:

- metadata column: if there is metadata (either via `meta` or as `sample_data` in the phyloseq object), the label object can be created by taking the information in a specific metadata column. In order to do so, `label` should be the name of the column, and `case` should indicate which group(s) should be the positive group(s). A typical example could look like that:
`siamcat <- siamcat(feat=feat.matrix,meta=metadata,label='DiseaseState',case='CRC')`
for the construction of a label to predict CRC status (which is encoded in the column "DiseaseState" of the metadata). For more control (e.g. specific labels for plotting or specific control state), the label can also be created outside of the `siamcat` function using the [create.label](#) function.
- named vector: the label can also be supplied as named vector which encodes the label either as characters (e.g. "Healthy" and "Diseased"), as factor, or numerically (e.g. -1 and 1). The vector must be named with the names of samples (corresponding to the samples in features). Also here, the information about the positive group(s) is needed via the `case` parameter. Internally, the vector is given to the [create.label](#) function.
- label object: A label object can be created with the [create.label](#) function or by reading a dedicated label file with [read.label](#).

Value

A new [siamcat-class](#) object

Examples

```
# example with package data
data("feat_crc_zeller", package="SIAMCAT")
data("meta_crc_zeller", package="SIAMCAT")

siamcat <- siamcat(feat=feat_crc_zeller,
                   meta=meta_crc_zeller,
                   label='Group',
                   case='CRC')
```

siamcat-class *The S4 SIAMCAT class*

Description

The SIAMCAT class

Details

The S4 SIAMCAT class stores the results from the SIAMCAT workflow in different slots. The different slots will be filled by different functions (referenced in the description below).

In order to construct a SIAMCAT class object, please refer to the documentation of the construction function [siamcat](#).

The SIAMCAT class is based on the [phyloseq-class](#). Therefore, you can easily import a phyloseq object into SIAMCAT.

Slots

`phyloseq` object of class [phyloseq-class](#)

`label` list containing the label information for the samples and some metadata about the label, created by [create.label](#) or when creating the **siamcat-class** object by calling [siamcat](#)

`filt_feat` list containing the filtered features as matrix and the list of filtering parameters, created by calling the [filter.features](#) function

`associations` list containing the parameters for association testing and the results of association testing with these parameters in a data frame, created by calling the [check.associations](#) function

`norm_feat` list containing the normalized features as matrix and the list of normalization parameters (for frozen normalization), created by calling the [normalize.features](#) function

`data_split` list containing cross-validation instances, created by calling the [create.data.split](#) function

`model_list` list containing the trained models, the type of model that was trained, and on which kind of features it was trained, created by calling the [train.model](#) function

`pred_matrix` matrix of predictions, created by calling the [make.predictions](#) function

`eval_data` list containing different evaluation metrics, created by calling the [evaluate.predictions](#) function

`siamcat.to.lefse` *create a lefse input file from siamcat object*

Description

This function creates a lefse input file from siamcat object

Usage

```
siamcat.to.lefse(siamcat, filename = "siamcat_output.txt")
```

Arguments

<code>siamcat</code>	object of class <code>siamcat-class</code>
<code>filename</code>	name of the input file to which data will be save

Value

nothing but data is written to a file

Examples

```
data(siamcat_example)
siamcat.to.lefse(siamcat_example)
```

`siamcat_example` *SIAMCAT example*

Description

Reduced version of the CRC dataset from Zeller et al. MSB 2014 (see <http://msb.embopress.org/content/10/11/766>), containing 100 features (15 associated features at 5% FDR in the original dataset and 85 random other features) and 141 samples, saved after the complete SIAMCAT pipeline has been run.

Thus, the example dataset contains entries in every slot of the SIAMCAT object (see `siamcat-class`), e.g., `eval_data` or `data_split`.

Mainly used for running the examples in the function documentation.

Source

<http://msb.embopress.org/content/10/11/766>

train.model*Model training*

Description

This function trains the a machine learning model on the training data

Usage

```
train.model(siamcat, method = c("lasso", "enet", "ridge", "lasso_ll",
  "ridge_ll", "randomForest"), stratify = TRUE, modsel.crit = list("auc"),
  min.nonzero.coeff = 1, param.set = NULL, perform.fs = FALSE, param.fs =
  list(thres.fs = 100, method.fs = "AUC", direction='absolute'),
  feature.type='normalized', verbose = 1)
```

Arguments

siamcat	object of class siamcat-class
method	string, specifies the type of model to be trained, may be one of these: c('lasso', 'enet', 'ridge', 'lasso_ll', 'ridge_ll', 'randomForest')
stratify	boolean, should the folds in the internal cross-validation be stratified?, defaults to TRUE
modsel.crit	list, specifies the model selection criterion during internal cross-validation, may contain these: c('auc', 'f1', 'acc', 'pr'), defaults to list('auc')
min.nonzero.coeff	integer number of minimum nonzero coefficients that should be present in the model (only for 'lasso', 'ridge', and 'enet'), defaults to 1
param.set	list, set of extra parameters for mlr run, may contain: <ul style="list-style-type: none"> • cost and class.weights - for lasso_ll and ridge_ll • alpha - for enet • ntree and mtry - for RandomForrest. See below for details. Defaults to NULL
perform.fs	boolean, should feature selection be performed? Defaults to FALSE
param.fs	list, parameters for the feature selection, must contain: <ul style="list-style-type: none"> • thres.fs - threshold for the feature selection, • method.fs - method for the feature selection, may be AUC, gFC, or Wilcoxon • direction - for AUC and gFC, select either the top associated features (independent of the sign of enrichment), the top positively associated featured, or the top negatively associated features, may be absolute, positive, or negative. Will be ignored for Wilcoxon. See Details for more information. Defaults to list(thres.fs=100,method.fs="AUC",direction='absolute')
feature.type	string, on which type of features should the function work? Can be either "original", "filtered", or "normalized". Please only change this parameter if you know what you are doing!

verbose	integer, control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1
---------	---

Details

This function performs the training of the machine learning model and functions as an interface to the `mlr`-package.

The function expects a `siamcat-class`-object with a prepared cross-validation (see `create.data.split`) in the `data_split`-slot of the object. It then trains a model for each fold of the datasplit.

For the machine learning methods that require additional hyperparameters (e.g. `lasso_ll`), the optimal hyperparameters are tuned with the function `tuneParams` within the `mlr`-package.

The different machine learning methods are implemented as `mlr`-tasks:

- '`lasso`', '`enet`', and '`ridge`' use the '`classif.cvglmnet`' Learner,
- '`lasso_ll`' and '`ridge_ll`' use the '`classif.LiblineaRL1LogReg`' and the '`classif.LiblineaRL2LogReg`' Learners respectively
- '`randomForest`' is implemented via the '`classif.randomForest`' Learner.

Hyperparameters You also have additional control over the machine learning procedure by supplying information through the `param.set` parameter within the function. We encourage you to check out the excellent [mlr documentation](#) for more in-depth information.

Here is a short overview which parameters you can supply in which form:

- `enet` The **alpha** parameter describes the mixture between lasso and ridge penalty and is - per default- determined using internal cross-validation (the default would be equivalent to `param.set=list('alpha'=c(0,1))`). You can supply either the limits of the hyperparameter exploration (e.g. with limits 0.2 and 0.8: `param.set=list('alpha'=c(0.2,0.8))`) or you can supply a fixed alpha value as well (`param.set=list('alpha'=0.5)`).
- `lasso_ll/ridge_ll` You can supply both **class.weights** and the **cost** parameter (cost of the constraints violation, see [LiblineaR](#) for more info). The default values would be equal to `param.set=list('class.weight'= seq(-2,3,length = 6 + 5 + 10))`.
- `randomForest` You can supply the two parameters **ntree** (Number of trees to grow) and **mtry** (Number of variables randomly sampled as candidates at each split). See also [randomForest](#) for more info. The default values correspond to `param.set=list('ntree'=c(100,1000), 'mtry'=c(round(sqrt.mdim / 2),round(sqrt.mdim),round(sqrt.mdim * 2)))` with `sqrt.mdim=sqrt(nrow(data))`.

Feature selection The function can also perform feature selection on each individual fold. At the moment, three methods for feature selection are implemented:

- '`AUC`' - computes the Area Under the Receiver Operating Characteristics Curve for each single feature and selects the top `param.fs$thres.fs`, e.g. 100 features
- '`gFC`' - computes the generalized Fold Change (see [check.associations](#)) for each feature and likewise selects the top `param.fs$thres.fs`, e.g. 100 features
- '`Wilcoxon`' - computes the p-Value for each single feature with the Wilcoxon test and selects features with a p-value smaller than `param.fs$thres.fs`

For AUC and gFC, feature selection can also be directed, that means that the features will be selected either based on the overall association (absolute - gFC will be converted to absolute values and AUC values below 0.5 will be converted by 1 -AUC), or on associations in a certain direction (positive - positive enrichment as measured by positive values of the gFC or AUC values higher than 0.5 - and reversely for negative).

Value

object of class [siamcat-class](#) with added `model_list`

Examples

```
data(siamcat_example)

# simple working example
siamcat_example <- train.model(siamcat_example, method='lasso')
```

validate.data

Validate samples in labels, features, and metadata

Description

This function checks if labels are available for all samples in features. Additionally validates metadata, if available.

Usage

```
validate.data(siamcat, verbose = 1)
```

Arguments

<code>siamcat</code>	an object of class siamcat-class
<code>verbose</code>	integer, control output: 0 for no output at all, 1 for only information about progress and success, 2 for normal level of information and 3 for full debug information, defaults to 1

Details

This function validates the data by checking that labels are available for all samples in the feature matrix. Furthermore, the number of samples per class is checked to ensure a minimum number. If metadata is available, the overlap between labels and metadata is checked as well.

This function is run when a [siamcat-class](#) object is created.

Value

an object of class [siamcat-class](#)

Examples

```
data(siamcat_example)

# validate.data should be run before completing the pipeline
# since the complete pipeline had been run on siamcat_example, we
# construct a new siamcat object for the example
feat <- orig_feat(siamcat_example)
label <- label(siamcat_example)
siamcat <- siamcat(feat=feat, label=label, validate=FALSE)
siamcat <- validate.data(siamcat, verbose=2)
```

weight_matrix

Retrieve the weight matrix from a SIAMCAT object

Description

Function to retrieve the feature weights from a SIAMCAT object

Usage

```
weight_matrix(siamcat, verbose=1)

## S4 method for signature 'siamcat'
weight_matrix(siamcat, verbose = 1)
```

Arguments

siamcat	(Required). An instance of siamcat-class that contains trained models
verbose	integer, if the slot is empty, should a message be printed? values can be either 0 (no output) or 1 (print message)

Details

The function extracts the feature weights from all trained models across all cross-validation folds and repeats.

Value

A matrix containing the feature weights or NULL

Examples

```
data(siamcat_example)
temp <- weight_matrix(siamcat_example)
temp[1:3, 1:3]
```
