Package 'paneltests'

May 9, 2026

Type Package

Title Panel Data Pre-Testing and Diagnostic Suite

Version 1.0.5

Description Pre-testing and diagnostic tools for panel data analysis. Researchers should run these tests before any panel regression to verify modelling assumptions. The package implements: (1) the Hsiao (2014, <ISBN:978-1-107-65763-2>) homogeneity F-tests (F1/F2/F3), Swamy (1970) <doi:10.2307/1913012> parameter heterogeneity test, and Pesaran (2004) <doi:10.2139/ssrn.572504> cross-sectional dependence test via xtpretest(); (2) missing-data detection, mechanism testing, and imputation for unbalanced panels via xtmispanel(); (3) quantile-regression cross-sectional dependence tests (T_tau and T-tilde_tau statistics) of Demetrescu, Hosseinkouchack and Rodrigues (2023) <doi:10.1016/j.jeconom.2022.09.001> via xtcsdq(); and (4) the panel quantile-regression slope homogeneity S-hat and D-hat statistics of Galvao, Juhl, Montes-Rojas and Olmo (2017) <doi:10.1080/07350015.2015.1054493> via xtqsh(). Together these tests address three fundamental pre-testing questions: (i) are slopes homogeneous? (ii) is there cross-sectional dependence? and (iii) is the panel balanced and is missingness ignorable?

Contents

`print.xtcsdq` *Print method for xtcsdq objects*

Description

Print method for xtcsdq objects

Usage

```
## S3 method for class 'xtcsdq'
print(x, ...)
```

Arguments

`x`	An object of class `"xtcsdq"`.
`...`	Additional arguments (ignored).

Value

Invisibly returns `x`.

`print.xtqsh` *Print Method for xtqsh Objects*

Description

Prints a formatted summary of an `"xtqsh"` test result.

Usage

```
## S3 method for class 'xtqsh'
print(x, ...)
```

Arguments

x	An object of class "xtqsh".
...	Additional arguments (ignored).

Value

Invisibly returns x.

---

qsh_sample *Sample Panel Dataset for Quantile Slope Homogeneity Testing*

Description

A simulated balanced panel dataset for demonstrating the quantile slope homogeneity test (xtqsh).

Usage

```
data(qsh_sample)
```

Format

A data frame with columns:

id Cross-sectional unit identifier.

time Time period identifier.

y Dependent variable.

x1 First explanatory variable.

x2 Second explanatory variable.

---

summary.xtcsdq *Summary method for xtcsdq objects*

Description

Summary method for xtcsdq objects

Usage

```
## S3 method for class 'xtcsdq'
summary(object, ...)
```

Arguments

object	An object of class "xtcsdq".
...	Additional arguments (ignored).

Value

Invisibly returns `object`.

`summary.xtqsh` *Summary Method for xtqsh Objects*

Description

Prints a summary of an `"xtqsh"` test result.

Usage

```
## S3 method for class 'xtqsh'
summary(object, ...)
```

Arguments

`object`	An object of class `"xtqsh"`.
`...`	Additional arguments (ignored).

Value

Invisibly returns `object`.

`xtcsdq` *Tests of No Cross-Sectional Dependence in Panel Quantile Regressions*

Description

Tests the null hypothesis of no cross-sectional error dependence (CSD) in panel quantile regressions. Implements the T_tau and T-tilde_tau statistics of Demetrescu, Hosseinkouchack and Rodrigues (2023).

Usage

```
xtcsdq(
  formula = NULL,
  data = NULL,
  index = NULL,
  quantiles,
  mode = c("pooled", "individual", "residuals"),
  residuals = NULL,
  bandwidth = NULL,
  correction = TRUE
)
```

Arguments

`formula`	A formula of the form `y ~ x1 + x2 + ...`. Required for `mode = "pooled"` (default) and `mode = "individual"`. Not used when `residuals` is provided.
`data`	A data frame containing the panel data in long format. Required unless `residuals` is provided.
`index`	A character vector of length 2: `c("id_var", "time_var")`. Required unless `residuals` is provided.
`quantiles`	A numeric vector of quantile levels, each strictly between 0 and 1.
`mode`	Estimation mode: `"pooled"` (default, pooled FE-QR), `"individual"` (per-unit QR), or `"residuals"` (provide pre-computed residuals via the `residuals` argument).
`residuals`	A list (or named list) of numeric vectors or a matrix with one column per quantile, containing pre-computed QR residuals. Only used when `mode = "residuals"`.
`bandwidth`	Numeric. KDE bandwidth for sparsity estimation. If `NULL` (default), uses $0.35(NT)^{-0.2}$.
`correction`	Logical. If `TRUE` (default), reports the bias-corrected T-tilde statistic in addition to T_tau.

Details

The T_tau statistic (Equation 3 in Demetrescu et al., 2023) tests for CSD by examining pairwise correlations of demeaned QR residuals across units. Under the null of no CSD, T_tau is asymptotically standard normal.

The bias-corrected version T-tilde_tau (Equation 5) subtracts two correction terms that account for the estimation uncertainty in the QR slope and the sparsity at the quantile. Reject H0 for large positive values.

The portmanteau statistic $M_K = K^{-1} \sum_{q=1}^{K} T_\tau^{(q)}$ aggregates across K quantile levels.

The KDE bandwidth defaults to $h = 0.35(NT)^{-0.2}$ as in the original paper.

Value

An object of class `"xtcsdq"` with components:

T_tau Numeric vector of T_tau statistics (one per quantile).

Ttilde_tau Numeric vector of bias-corrected T-tilde_tau statistics.

pval_T p-values for T_tau.

pval_Ttilde p-values for T-tilde_tau.

fhat KDE density estimates at zero (one per quantile).

M_K Portmanteau statistic (average of T_tau over quantiles).

Mtilde_K Bias-corrected portmanteau statistic.

pval_M p-value for M_K.

pval_Mc p-value for Mtilde_K.

quantiles Quantile levels used.

N Number of cross-sectional units.

TT Number of time periods.

bandwidth KDE bandwidth used.

Demetrescu, M., Hosseinkouchack, M. and Rodrigues, P.M.M. (2023). Testing for No Cross-Sectional Error Dependence in Panel Quantile Regressions. *Ruhr Economic Papers*, No. 1041. doi:10.4419/96973002

Examples

```
set.seed(42)
n <- 8; tt <- 20
dat <- data.frame(
  id   = rep(1:n, each = tt),
  time = rep(1:tt, times = n),
  y    = rnorm(n * tt),
  x1   = rnorm(n * tt)
)
res <- xtcsdq(y ~ x1, data = dat, index = c("id", "time"),
              quantiles = c(0.25, 0.5, 0.75))
print(res)
summary(res)
```

`xtmispanel` *Missing Data Detection and Imputation for Panel Data*

Description

Detects, diagnoses, and imputes missing values in panel (longitudinal) data sets. The function can produce summary tables (Module 1), test the missingness mechanism (Module 2), impute a target variable (Module 3), and run a cross-method sensitivity analysis (Module 4).

Usage

```
xtmispanel(
  data,
  vars = NULL,
  index,
  detect = TRUE,
  test = FALSE,
  impute = NULL,
  target = NULL,
  new_var = NULL,
  sensitivity = FALSE,
  knn_k = 5L
)
```

Arguments

data	A data.frame in long format.
vars	Character vector of variable names to analyse. If NULL (default), all numeric columns except the index are used.
index	Character vector of length 2: c("panel_id", "time_id").
detect	Logical. Run Module 1 (detection tables, default TRUE).
test	Logical. Run Module 2 (MCAR/MAR mechanism tests, default FALSE).
impute	Character or NULL. If a method name is given, run Module 3 (imputation). Supported methods: "mean", "median", "locf", "nocb", "linear", "spline", "pmm", "hotdeck", "knn", "rf", "em".
target	Character. Name of the variable to impute (required when impute is not NULL).
new_var	Character. Name of the output imputed variable (default "\{target\}_imp").
sensitivity	Logical. Run Module 4 (sensitivity analysis across all imputation methods, default FALSE).
knn_k	Integer. Number of neighbours for KNN imputation (default 5).

Value

A list (invisibly) with components:

detect Summary statistics per variable/panel/period.

test MCAR and MAR test results.

imputed The data frame augmented with the imputed column (when imputation is requested).

impute_stats Summary comparing original vs imputed.

sensitivity Sensitivity analysis results.

Little, R. J. A. (1988). A test of missing completely at random for multivariate data with missing values. *Journal of the American Statistical Association*, 83(404), 1198-1202. doi:10.1080/01621459.1988.10478714

Examples

```
set.seed(1)
df <- data.frame(
  id   = rep(1:4, each = 8),
  time = rep(1:8, times = 4),
  y    = c(rnorm(32))
)
# introduce some NAs
df$y[c(3, 11, 20)] <- NA
res <- xtmispanel(df, vars = "y", index = c("id", "time"), detect = TRUE)
```

`xtpretest` *Comprehensive Panel Data Pre-Testing Suite*

Description

Performs a full battery of panel data pre-tests: Hsiao (2014) homogeneity F-tests, robust (HC1) versions, Swamy (1970) parameter heterogeneity test, cross-sectional dependence (Pesaran 2004), and panel summary statistics.

Usage

```
xtpretest(
  data,
  formula,
  index,
  tests = "ALL",
  level = 0.05
)
```

Arguments

`data`	A `data.frame` in long format containing all variables.
`formula`	A two-sided formula of the form `y ~ x1 + x2 + ...` specifying the dependent and independent variables.
`index`	Character vector of length 2: `c("panel_id", "time_id")`.
`tests`	Character vector. Which modules to run. Possible values: `"summary"`, `"hsiao"`, `"robust"`, `"heterogeneity"`, `"csd"`. Default `"ALL"` runs everything.
`level`	Numeric. Significance level for decisions (default 0.05).

Value

A list (invisibly) with components:

`summary` Panel summary statistics.

`hsiao` Hsiao homogeneity F-test results.

`robust` Robust HC1 F-test results.

`swamy` Swamy heterogeneity test results.

`csd` Cross-sectional dependence test results.

`recommendation` Character. Suggested estimator.

Pesaran, M. H. (2004). General diagnostic tests for cross section dependence in panels. Cambridge Working Paper in Economics, No. 0435. doi:10.2139/ssrn.572504

Examples

```
set.seed(10)
n <- 5; t <- 10
df <- data.frame(
  id   = rep(1:n, each = t),
  time = rep(1:t, times = n),
  y    = rnorm(n * t),
  x1   = rnorm(n * t)
)
res <- xtpretest(df, y ~ x1, index = c("id", "time"),
                 tests = c("hsiao", "csd"))
```

`xtqsh` *Quantile Regression Slope Homogeneity Test for Panel Data*

Description

Tests the null hypothesis of slope homogeneity in panel quantile regressions. Implements the S-hat and D-hat statistics of Galvao et al. (2017).

Usage

```
xtqsh(formula, data, index, tau, bw = "hallsheather", marginal = FALSE)
```

Arguments

`formula`	A formula of the form `y ~ x1 + x2 + ...`.
`data`	A data frame containing the panel data in long format.
`index`	Character vector of length 2: `c("id_var", "time_var")`.
`tau`	Numeric vector of quantile levels, each strictly between 0 and 1.
`bw`	Bandwidth method: `"hallsheather"` (default) or `"bofinger"`.
`marginal`	Logical. If `TRUE`, compute per-variable marginal tests. Default `FALSE`.

Value

An object of class `"xtqsh"` containing test statistics and p-values.

Examples

```
set.seed(42)
n <- 10; tt <- 20
dat <- data.frame(
  id   = rep(1:n, each = tt),
  time = rep(1:tt, times = n),
  y    = rnorm(n * tt),
  x1   = rnorm(n * tt)
)
res <- xtqsh(y ~ x1, data = dat, index = c("id", "time"), tau = 0.5)
print(res)
```
