

Package ‘ClusterBootstrap’

January 20, 2025

Title Analyze Clustered Data with Generalized Linear Models using the Cluster Bootstrap

Date 2021-02-16

Version 1.1.2

Description Provides functionality for the analysis of clustered data using the cluster bootstrap.

Depends R (>= 3.0), stats, utils, graphics, parallel, magrittr, dplyr

Index**13****clusbootglm***Fit generalized linear models with the cluster bootstrap***Description**

Fit a generalized linear model with the cluster bootstrap for analysis of clustered data.

Usage

```
clusbootglm(
  model,
  data,
  clusterid,
  family = gaussian,
  B = 5000,
  confint.level = 0.95,
  n.cores = 1
)
```

Arguments

model	generalized linear model to be fitted with the cluster bootstrap. This should either be a formula (or be able to be interpreted as one) or a <code>glm</code> / <code>lm</code> object. From the <code>(g)lm</code> objects, the formula will be used.
data	dataframe that contains the data.
clusterid	variable in data that identifies the clusters.
family	error distribution to be used in the model, e.g. <code>gaussian</code> or <code>binomial</code> .
B	number of bootstrap samples.
confint.level	level of confidence interval.
n.cores	number of CPU cores to be used.

Details

Some useful methods for the obtained `clusbootglm` class object are `summary.clusbootglm`, `coef.clusbootglm`, and `clusbootsample`.

Value

`clusbootglm` produces an object of class "clusbootglm", containing the following relevant components:

- `coefficients` A matrix of B rows, containing the parameter estimates for all bootstrap samples.
- `bootstrap.matrix` n*B matrix, of which each column represents a bootstrap sample; each value in a column represents a unit of `subjectid`.
- `lm.coefs` Parameter estimates from a single (generalized) linear model.
- `boot.coefs` Mean values of the paramater estimates, derived from the bootstrap coefficients.
- `boot.sds` Standard deviations of cluster bootstrap parameter estimates.
- `ci.level` User defined confidence interval level.
- `percentile.interval` Confidence interval based on percentiles, given the user defined confidence interval level.
- `parametric.interval` Confidence interval based on `lm.coefs` and column standard deviations of `coefficients`, given the user defined confidence interval level.
- `BCa.interval` Confidence interval based on percentiles with bias correction and acceleration, given the user defined confidence interval level.
- `samples.with.NA.coef` Cluster bootstrap sample numbers with at least one coefficient being NA.
- `failed.bootstrap.samples` For each of the coefficients, the number of failed bootstrap samples are given.

Author(s)

Mathijs Deen, Mark de Rooij

Examples

```
## Not run:
data(opposites)
clusbootglm(SCORE~Time*COG,data=opposites,clusterid=Subject)
## End(Not run)
```

clusbootsample	<i>Return data for specified bootstrap sample</i>
----------------	---

Description

Returns the full data frame for a specified bootstrap sample in a `clusbootglm` object.

Usage

```
clusbootsample(object, samplenr)
```

Arguments

- object** object of class `clusbootglm`, created with the `clusbootglm` function.
samplenr sample number for which the data frame should be returned.

Author(s)

Mark de Rooij, Mathijs Deen

Examples

```
## Not run:
data(opposites)
cbglm.1 <- clusbootglm(SCORE~Time*COG,data=opposites,clusterid=Subject)
clusbootsample(cbgm.1, samplenr=1)
## End(Not run)
```

coef.clusbootglm *Obtain coefficients from cluster bootstrap object*

Description

Returns the coefficients of an object of class `clusbootglm`.

Usage

```
## S3 method for class 'clusbootglm'
coef(object, estimate.type = "bootstrap", ...)
```

Arguments

- object** object of class `clusbootglm`.
estimate.type type of coefficient (bootstrap or GLM).
... other arguments.

Author(s)

Mathijs Deen

Examples

```
## Not run:
data(opposites)
cbglm.1 <- clusbootglm(SCORE~Time*COG,data=opposites,clusterid=Subject)
coef(cbgm.1, estimate.type="bootstrap")
## End(Not run)
```

`confint.clusbootglm` *Confidence intervals for cluster bootstrap model parameters*

Description

Computes confidence intervals for one or more parameters in a fitted GLM with the cluster bootstrap.

Usage

```
## S3 method for class 'clusbootglm'
confint(object, parm = "all", level = 0.95, interval.type = "BCa", ...)
```

Arguments

<code>object</code>	object of class <code>clusbootglm</code> .
<code>parm</code>	a specification of which parameters are to be given confidence intervals, either a vector of numbers or a vector of names. Defaults to all parameters.
<code>level</code>	the required confidence level
<code>interval.type</code>	type of confidence level. Options are <code>BCa</code> , <code>percentile</code> , and <code>parametric</code> .
<code>...</code>	other arguments.

Author(s)

Mathijs Deen

Examples

```
## Not run:
data(opposites)
cbglm.1 <- clusbootglm(SCORE~Time*COG,data=opposites,clusterid=Subject)
confint(cbgm.1,parm=c("Time","COG"), level=.90, interval.type="percentile")
## End(Not run)
```

`emm`

Calculate estimated marginal means for a cluster bootstrap GLM

Description

Returns the estimated marginal means of an `clusbootglm` object. This function works with a maximum of one between-subjects and one within-subjects variable.

Usage

```
emm(object, confint.level = 0.95)
```

Arguments

- `object` object of class `clusbootglm`.
- `confint.level` level of the confidence interval.

Value

`emmmeans` returns an object of class `clusbootemm`, containing the following components:

- `grid` Grid with estimated marginal means for each combination of levels of the variables.
- `bootstrapsample.emm` p^*B matrix, with p being the number of estimates and B being the number of bootstrap samples.

Author(s)

Mathijs Deen

Examples

```
## Not run:
medication <- medication[medication$time %% 1 == 0,]
medication$time_f <- as.factor(medication$time)
set.seed(1)
model.1 <- clusbootglm(pos~time_f*treat, clusterid = id, data = medication)
emm.1 <- emm(object = model.1)
summary(object = emm.1)
## End(Not run)
```

medication	<i>Medication data</i>
------------	------------------------

Description

The `medication` dataframe consists of 1242 observations within 73 individuals that were part of a placebo controlled clinical trial, as reported in Tomarken, Shelton, Elkins, and Anderson (1997).

The data were retrieved from the accompanied website of Singer & Willett (2003), at <https://stats.idre.ucla.edu/other/examples>

Usage

`medication`

Format

the following variables are available:

- `id`: subject indicator
- `treat`: either placebo (0) or antidepressant (1)
- `time`: number of days since trial start.
- `pos`: positive affect. Higher scores indicate a more positive mood.

opposites

Opposites naming data

Description

The opposites dataframe consists of 144 observations within 36 individuals that completed an inventory that assesses their performance on a timed cognitive task called "opposites naming".

The dataset does not contain the empirical data within 35 individuals from the experiment by Willett (1988), but a simulation based on the multilevel model from Singer & Willett (2003) within 36 individuals.

Usage

opposites

Format

the following variables are available:

- Subject: subject indicator
- Time: a time variable, ranging 0-3
- COG: cognitive skill, measured once (at time=0)
- SCORE: score on opposites naming task

plot.clusbootemm *Plot estimated marginal means for a cluster bootstrap GLM*

Description

Plots the estimated marginal means of an `clusbootglm` object. Works with one within-subjects and/or one between-subjects variable.

Usage

```
## S3 method for class 'clusbootemm'
plot(
  x,
  within,
  between,
  pch,
  lty,
  ylab = "Estimated marginal mean",
  xlab = "Within subject",
  ...
)
```

Arguments

<code>x</code>	object of class <code>clusbootemm</code> .
<code>within</code>	within-subjects variable. Should be numeric or numerically labeled factor.
<code>between</code>	between-subjects variable.
<code>pch</code>	point character. Length must be equal to the number of between-subjects levels.
<code>lty</code>	linetype. Length must be equal to the number of between-subjects levels.
<code>ylab</code>	label for y-axis.
<code>xlab</code>	label for x-axis.
<code>...</code>	other arguments to be passed to the <code>plot</code> function (see par).

Author(s)

Mathijs Deen

Examples

```
## Not run:
medication <- medication[medication$time %% 1 == 0,]
medication$time_f <- as.factor(medication$time)
set.seed(1)
model.1 <- clusbootglm(pos~time_f*treat, clusterid=id, data=medication)
emm.1 <- emm(object = model.1)
plot(x = emm.1, within = time_f, between = treat, pch = c(15,17), lty = c(1,2))
## End(Not run)
```

<code>plot.clusbootptest</code>	<i>Plot results of a permutation test</i>
---------------------------------	---

Description

Plot results of a permutation test performed with ptest

Usage

```
## S3 method for class 'clusbootptest'
plot(x, pcol = "red", pty = 1, mfrow = c(1, 1), ...)
```

Arguments

<code>x</code>	object of class <code>clusbootptest</code>
<code>pcol</code>	color of vertical line indicating the observed Welch t test statistic
<code>pty</code>	type of vertical line indicating the observed Welch t test statistic
<code>mfrow</code>	vector of length 2 indicating the numbers of rows and columns in which the histograms will be drawn on the device.
<code>...</code>	other arguments to be passed into the <code>hist</code> function.

Author(s)

Mathijs Deen, Mark de Rooij

Examples

```
## Not run:
medication <- medication[medication$time %% 1 == 0,]
set.seed(1)
permtest.1 <- ptest(data = meds, outcome = pos, within = time, between = treat,
                     at.within = c(0,2,4,6), at.between = c(0,1), pn = 2000)
plot(permtest.1, pcol = "red", pty=2, mfrow = c(2,2), breaks="FD")
## End(Not run)
```

<code>ptest</code>	<i>Permutation test for group differences at within-subject levels</i>
--------------------	--

Description

Perform permutation tests for differences between two groups at given within-subject levels in a long-formatted dataframe

Usage

```
ptest(
  data,
  outcome,
  within,
  between,
  at.within,
  at.between,
  pn = 1000,
  progress.bar = TRUE
)
```

Arguments

<code>data</code>	dataframe that contains the data in long format.
<code>outcome</code>	outcome variable (i.e., the variable for which the difference should be tested).
<code>within</code>	within-subject variable.
<code>between</code>	between-subjects variable.
<code>at.within</code>	determine for which within-subject levels (e.g., which timepoint) the difference should be tested.
<code>at.between</code>	determine the groups in the difference test (should always be of length 2).
<code>pn</code>	the number of permutations that should be performed.
<code>progress.bar</code>	indicates whether a progress bar will be shown.

Details

In every permutation cycle, the outcome variable gets permuted and the Welch t test statistic is calculated.

Value

`ptest` produces an object of class "clusbootptest", containing the following relevant components:

<code>perm.statistics</code>	A matrix of <code>length(at.within)</code> rows and <code>pn</code> columns, containing the Welch t-test statics for all permutations within the <code>at.within</code> level in the columns. The first column contains the t statistic for the observed data.
<code>pvalues</code>	Data frame containing the p values for every <code>at.within</code> level.

Author(s)

Mathijs Deen, Mark de Rooij

See Also

A useful method for the obtained `clusbootptest` class object is [plot.clusbootptest](#).

Examples

```
## Not run:
medication <- medication[medication$time %% 1 == 0,]
set.seed(1)
permtest.1 <- ptest(data = meds, outcome = pos, within = time, between = treat,
                     at.within = c(0,2,4,6), at.between = c(0,1), pn = 2000)
permtest.1$pvalues
## End(Not run)
```

summary.clusbootemm *Summarize estimated marginal means for cluster bootstrap GLM into a grid*

Description

Returns the summary of the EMM for a `clusbootglm` class object.

Usage

```
## S3 method for class 'clusbootemm'
summary(object, ...)
```

Arguments

object	object of class <code>clusbootemm</code> .
...	other arguments.

Author(s)

Mathijs Deen

Examples

```
## Not run:
medication <- medication[medication$time %% 1 == 0,]
medication$time_f <- as.factor(medication$time)
set.seed(1)
model.1 <- clusbootglm(pos~time_f*treat, clusterid=id, data=medication)
emm.1 <- emm(object = model.1)
summary(object = emm.1)
## End(Not run)
```

summary.clausbootglm *Summarize output of cluster bootstrap GLM*

Description

Returns the summary of an object of class `clausbootglm`.

Usage

```
## S3 method for class 'clausbootglm'
summary(object, estimate.type = "bootstrap", interval.type = "BCa", ...)
```

Arguments

- `object` object of class `clausbootglm`.
- `estimate.type` specify which type of estimate should be returned, either bootstrap means (default) or GLM estimates from model fitted on original data.
- `interval.type` which confidence interval should be used. Options are `parametric`, `percentile`, and `BCa` intervals.
- `...` other arguments.

Author(s)

Mathijs Deen

Examples

```
## Not run:
data(opposites)
cbglm.1 <- clausbootglm(SCORE~Time*COG,data=opposites,clusterid=Subject)
summary(cbgm.1, interval.type="percentile")
## End(Not run)
```
