

Package ‘SimReg’

January 20, 2025

Type Package

Title Similarity Regression

Version 3.4

Date 2024-02-20

Encoding UTF-8

Author Daniel Greene

Maintainer Daniel Greene <dg333@cam.ac.uk>

Description Similarity regression,
evaluating the probability of association between sets of ontological terms
and binary response vector. A no-association model is compared with one in which
the log odds of a true response is linked to the semantic similarity
between terms and a latent characteristic ontological profile - 'Phenotype Similarity Regres-
sion for Identifying the Genetic Determinants of Rare Dis-
eases', Greene et al 2016 <[doi:10.1016/j.ajhg.2016.01.008](https://doi.org/10.1016/j.ajhg.2016.01.008)>.

SimReg-package *Similarity Regression Functions*

Description

Functions for performing Bayesian similarity regression, and evaluating the probability of association between sets of ontological terms and binary response vector. A random model is compared with one in which the log odds of a true response is linked to the semantic similarity between terms and a latent characteristic ontological profile.

Details

Key functions include sim_reg, for similarity regression of binary response variable against an ontologically encoded predictor. An example application would be inferring the probability of association between the presence of a rare genetic variant conditional on an ontologically encoded phenotype.

get_terms	<i>Get full set of terms to use in inference procedure based on similarity function arguments</i>
-----------	---

Description

Get full set of terms to use in inference procedure based on similarity function arguments

Usage

```
get_terms(args)
```

Arguments

args	Named list of named arguments which gets passed to ontological similarity function by sim_reg.
------	--

Value

Character vector of term IDs.

get_term_marginals	<i>Calculate marginal probability of terms inclusion in phi from sim_reg_out object</i>
--------------------	---

Description

Calculate marginal probability of terms inclusion in phi from sim_reg_out object

Usage

```
get_term_marginals(sim_reg_out)
```

Arguments

sim_reg_out	Object of class sim_reg_output.
-------------	---------------------------------

Value

Numeric vector of probabilities, named by term ID.

<code>log_BF</code>	<i>Calculate log Bayes factor for similarity the model, gamma=1 and baseline model, gamma=0.</i>
---------------------	--

Description

Calculate log Bayes factor for similarity the model, `gamma=1` and baseline model, `gamma=0`.

Usage

```
log_BF(x, ...)

## Default S3 method:
log_BF(x, ...)

## S3 method for class 'sim_reg_output'
log_BF(x, ...)
```

Arguments

- `x` list of term sets or `sim_reg_output` object.
- `...` If `x` is a list term sets, other arguments to pass to `sim_reg`, otherwise this is not used.

Value

Numeric value.

`plot.sim_reg_summary` *Plot summary of sim_reg_output object*

Description

Plot summary of `sim_reg_output` object

Usage

```
## S3 method for class 'sim_reg_summary'
plot(x, ...)

## S3 method for class 'sim_reg_output'
plot(x, ...)
```

Arguments

- `x` Object of class `sim_reg_summary`.
- `...` Additional arguments to pass to `plot_term_marginals`.

plot_term_marginals *Create ontological plot of marginal probabilities of terms*

Description

Create ontological plot of marginal probabilities of terms

Usage

```
plot_term_marginals(  
  ontology,  
  term_marginals,  
  max_terms = 10,  
  min_probability = 0.01,  
  ...  
)
```

Arguments

ontology ontology_index object.
term_marginals Numeric vector of marginal probabilities of inclusion in phi for individual terms, named by the term IDs.
max_terms Maximum number of terms to include in plot. Note that additional terms may be included when terms have the same marginal probability, and common ancestor terms are included.
min_probability Threshold probability of inclusion in phi for triggering inclusion in plot.
... Additional arguments to pass to onto_plot

posterior_prediction *Predicted probability of y given x conditional on association and given data.*

Description

Predicted probability of y given x conditional on association and given data.

Usage

```
posterior_prediction(  
  ontology,  
  x,  
  y,  
  sim_reg_out,
```

```

x_new = x,
information_content = get_term_info_content(ontology, x),
sim_params = list(ontology = ontology, information_content = information_content),
two_way = TRUE,
prediction_fn = NULL,
min_ratio = 0.001,
...
)

```

Arguments

<code>ontology</code>	ontology_index object.
<code>x</code>	list of character vectors of ontological terms.
<code>y</code>	logical response vector.
<code>sim_reg_out</code>	Object of class <code>sim_reg_output</code> .
<code>x_new</code>	New list of ontological term sets to perform prediction on. Defaults to <code>x</code> .
<code>information_content</code>	Numeric vector of information contents of terms named by term ID. Defaults to information content based on frequencies of annotation in <code>x</code> .
<code>sim_params</code>	List of arguments to pass to <code>get_asym_sim_grid</code> .
<code>two_way</code>	Boolean value determining whether to calculate semantic similarity ‘in both directions’ (i.e. compute <code>s_x</code> and <code>s_phi</code> or just <code>s_phi</code>).
<code>prediction_fn</code>	Function for computing predicted probabilities for <code>y[i]=TRUE</code> .
<code>min_ratio</code>	Threshold for fraction of posterior probability which sampled phi must hold in order to be included in sum.
<code>...</code>	Additional arguments to pass to <code>prediction_fn</code> .

Value

Vector of predicted probabilities corresponding to term sets in `x_new`.

`print.sim_reg_output` *Print sim_reg_output object*

Description

Print `sim_reg_output` object

Usage

```
## S3 method for class 'sim_reg_output'
print(x, ...)
```

Arguments

<code>x</code>	Object of class <code>sim_reg_output</code> .
<code>...</code>	Non-used arguments.

`print.sim_reg_summary` *Print sim_reg_summary object*

Description

Print `sim_reg_summary` object

Usage

```
## S3 method for class 'sim_reg_summary'  
print(x, ...)
```

Arguments

<code>x</code>	Object of class <code>sim_reg_summary</code> .
<code>...</code>	Non-used arguments.

`prob_association` *Calculate probability of association between y and x*

Description

Calculate probability of association between y and x

Usage

```
prob_association(..., prior = 0.05)
```

Arguments

<code>...</code>	Arguments to pass to <code>log_BF</code> .
<code>prior</code>	Numeric value determining prior probability that $\gamma=1$.

Value

Numeric value.

sim_reg*Similarity regression*

Description

Performs Bayesian ‘similarity regression’ on given logical response vector *y* against list of ontological term sets *x*. It returns an object of class *sim_reg_output*. Of particular interest are the probability of an association, which can be calculated with [prob_association](#), and the characteristic ontological profile *phi*, which can be visualised using the functions [plot_term_marginals](#), and [term_marginals](#)). The results can be summarised with *summary*.

Usage

```
sim_reg(
  ontology,
  x,
  y,
  information_content = get_term_info_content(ontology, x),
  sim_params = list(ontology = ontology, information_content = information_content),
  using_terms = get_terms(sim_params),
  term_weights = rep(0, length(using_terms)),
  prior = discrete_gamma(using_terms),
  min_BF = -Inf,
  max_select = 2000L,
  max_phi_count = 200L,
  two_way = TRUE,
  selection_fn = fg_step_tab(N = length(y)),
  lik_method = NULL,
  lik_method_args = list(),
  gamma0_ml = bg_rate,
  min_ratio = 1e-04,
  ...
)
```

Arguments

<i>ontology</i>	ontology_index object.
<i>x</i>	list of character vectors of ontological terms.
<i>y</i>	logical response vector.
<i>information_content</i>	Numeric vector of information contents of terms named by term ID. Defaults to information content based on frequencies of annotation in <i>x</i> .
<i>sim_params</i>	List of arguments to pass to <i>get_asym_sim_grid</i> .
<i>using_terms</i>	Character vector of term IDs giving the complete set of terms to include in the the <i>phi</i> parameter space.

term_weights	Numeric vector of prior weights for individual terms.
prior	Function for computing the unweighted prior probability of a phi value.
min_BF	Bayes factor threshold below which to terminate computation, enabling faster execution time at the expense of accuracy and precision.
max_select	Upper bound for number of phi values to sample.
max_phi_count	Upper bound for number of phi values to include in final likelihood sum.
two_way	Boolean value determining whether to calculate semantic similarity ‘in both directions’ (i.e. compute s_x and s_phi or just s_phi).
selection_fn	Function for selecting values of phi with high posterior mass.
lik_method	Function for calculating marginal likelihood conditional on values of phi.
lik_method_args	List of additional arguments to pass to lik_method.
gamma0_ml	Function for computing marginal likelihood of data under baseline model gamma=0.
min_ratio	Lower bound on ratio below which to discard phi values.
...	Additional arguments to pass to selection_fn.

summary.sim_reg_output*Get summary of sim_reg_output object***Description**

Get summary of sim_reg_output object

Usage

```
## S3 method for class 'sim_reg_output'
summary(object, prior = 0.05, ...)
```

Arguments

object	Object of class sim_reg_output.
prior	Prior probability of association.
...	Non-used arguments.

<code>sum_log_probs</code>	<i>Calculate sum of log probabilities on log scale without over/under-flow</i>
----------------------------	--

Description

Calculate sum of log probabilities on log scale without over/under-flow

Usage

```
sum_log_probs(log_probs)
```

Arguments

`log_probs` Numeric vector of probabilities on log scale.

Value

Numeric value on log scale.

<code>term_marginals</code>	<i>Calculate marginal probability of terms inclusion in phi</i>
-----------------------------	---

Description

Calculate marginal probability of terms inclusion in phi

Usage

```
term_marginals(...)
```

Arguments

... Arguments to pass to [sim_reg](#).

Value

Numeric vector of probabilities, named by term ID.
