1.3 Get Source Code

1.3.1 Software Components

digiKam project use a single git repository from GitLab to host whole source code base. The project page is given below:

https://invent.kde.org/graphics/digikam

The digikam handbook source code is hosted in a separate GitLab repository:

https://invent.kde.org/documentation/digikam-doc

1.4 Development Environment

If you are a developer with push access to the git repositories, it is strongly recommended to use the "kde:" prefix and let git use the read-only mirrors for pulling.

If you did not clone this repository from "kde:", do it again:

```
git config --global url.git://anongit.kde.org/.insteadof kde:
git config --global url.ssh://git@git.kde.org/.pushinsteadof kde:
git clone kde:digikam
```

See below an example of .gitconfig file working with a developer account:

```
[url "git://anongit.kde.org/"]
        insteadof = kde://

[url "git@git.kde.org:"]
        pushinsteadof = kde://

[url "ssh://git@git.kde.org/"]
        pushinsteadof = kde://

```

```
        up = pull --rebase -v --stat

1.5 Cmake Configuration Options

To configure the project with CMake, use dedicated "bootstrap" script for your platform where all available configuration options are present with default values.

There are two configuration sections : the top level and the core.

1.5.1 Top Level Configuration

- Packaging options:
  - **DIGIKAMSC_COMPILE_DIGIKAM** : Build digiKam core (default=ON).
  - **DIGIKAMSC_COMPILE_PO** : Build application translations files. (default=OFF).
- Developers only options:
  - **BUILD_TESTING=ON** : Build tests code (default=ON).
  - **BUILD_WITH_QT6=ON** : Build with Qt6 framework, else Qt5 (default=OFF).

1.5.2 Core Configuration

- Extra feature support options:
  - **ENABLE_KFILEMETADATASUPPORT** : Build digiKam with KDE files indexer support (default=OFF).

  - **ENABLE_AKONADICONTACTSUPPORT** : Build digiKam with KDE Mail Contacts support (default=OFF).
  - **ENABLE_GEOLOCATION** : Build digiKam with Geolocation support (default=ON).
  - **ENABLE_MEDIAPLAYER** : Build digiKam with Media Player support (default=ON).
  - **ENABLE_DBUS** : Build digiKam with DBUS support (default=ON).
  - **ENABLE_APPSTYLES** : Build digiKam with support for changing the widget application style (default=OFF).
  - **ENABLE_KIO** : Build digiKam with KIO support (default=ON).

- Database options
  - **ENABLE_MYSQLSUPPORT** : Build digiKam with MySQL dabatase support (default=ON).
  - **ENABLE_INTERNALMYSQL** : Build digiKam with internal MySQL server executable (default=ON).

- Showfoto application options
  - **ENABLE_SHOWFOTO** : Build Showfoto stand-alone image editor application (default=ON).

- Developers only options:
  - **ENABLE_DIGIKAM_MODELTEST** : Enable ModelTest on some models for debugging (default=OFF).
  - **ENABLE_SANITIZERS** : Enable ASAN and UBSAN sanitizers when available (default=OFF).
  - **BUILD_WITH_CCACHE** : Use ccache to speed up compilations (default=OFF)

1.6 Setup Local Compilation and Run-Time

This section describes how to install digiKam from the git repository, while keeping a system-wide digiKam install.

This procedure is based on the configure script **bootstrap.local**

1. Set the root directory for your git install in bootstrap.local (DIGIKAM_INSTALL_PREFIX variable)
2. If you want a clean build directory, set CLEANROOT to 1
3. Type the following command in your terminal:

```
$ ./bootstrap.local  # or "./bootstrap.local --eclipse" if you intend to use Eclipse
$ cd build
$ make
$ make install
$ KDESYCOCA="/your/root/directory/var/tmp/kde-$USER/ksycoca5" kbuildsycoca5
```

To run digikam, use the following commands:

```
$ export KDESYCOCA=/your/root/directory/var/tmp/kde-$USER/ksycoca5
$ export QT_PLUGIN_PATH=/your/root/directory/lib64/plugins:/your/root/directory/lib/plugins:$QT_PLUGIN_PATH
$ export XDG_DATA_DIRS=/your/root/directory/share:$XDG_DATA_DIRS
$ /your/root/directory/bin/digikam
```

The same applies for all binaries in /your/root/directory/bin/

If your shell is bash, you can edit your .bashrc file (in $HOME) and add the following alias:

```
DIGIKAMROOT="/your/root/directory"
alias digikam-dev="KDESYCOCA=\$DIGIKAMROOT/var/tmp/kde-$USER/ksycoca5
      XDG_DATA_DIRS=\$DIGIKAMROOT/share:\$XDG_DATA_DIRS
      QT_PLUGIN_PATH=\$DIGIKAMROOT/lib64/plugins:\$DIGIKAMROOT/lib/plugins:\$QT_PLUGIN_PATH
      \$DIGIKAMROOT/bin/digikam"
```

then you can start your newly installed digikam with

```
$ digikam-dev
```

1.7 Debug Traces At Run-Time

digiKam uses categorized logging at run-time. By default, all debug messages are printed on the console. To disable output, you can either fine-grained control by using one or more logging categories listed below.

Note: under Windows, to catch all debug messages you need to install an extra Microsoft application named DebugView available at this url: http://technet.microsoft.com/en-us/sysinternals/bb896647.aspx

1.7.1 Logging Using an Environment Variable

You can set the environment variable **QT_LOGGING_RULES**. Rules are divided by semicolons.

E.g. you can start digiKam like this on the command line with thumbnails and core database messages disabled:

```
export QT_LOGGING_RULES='digikam.thumbsdb=false:digikam.coredb=false'
digikam
```

1.7.2 Logging Categories in digiKam

All logging categories are listed in

1.8 Cmake compilation rules

1.8.1 Introduction

The whole project is written mostly in C++/Qt and the Cmake framework is used to compile under Linux, macOS, and Windows. The Cmake rules have been configured to reduce the linking overhead and improve CPU utilization with modular design.

Independent Cmake configuration is presents in following folders:

- root source dir
- core
- doc

The Cmake rules will build the following targets:

- digikamcore shared lib

- digikamdatabase shared lib
- digikamgui shared lib
- digikam executable
- showfoto executable
- plugin shared libraries (dplugins)
- various test executables - if testing is enabled
- various unit-tests - if testing is enabled

Each of them depend on various sources which must be compiled before. A complete description of source code direction is given to the sourcedirs section.

1.8.2 CMake Implementation Details

1.8.2.1 Include Directories

Local include directories are all managed by this snippet of code:

```
set(DK_INCLUDES_ALL "")
HEADER_DIRECTORIES(DK_LOCAL_INCLUDES_RAW)
```

The libjpeg- folders are all included, so we need to delete them all and include the correct one only:

```
# This macro will set all paths which do not contain libjpeg-
# We will add later the directory we need

FOREACH(var ${DK_LOCAL_INCLUDES_RAW})
    STRING(REGEX MATCH "libjpeg-" item ${var})
    IF(item STREQUAL "")
        LIST(APPEND DK_LOCAL_INCLUDES ${var})
    ENDIF(item)
ENDFOREACH(var)

set(DK_LOCAL_INCLUDES ${DK_LOCAL_INCLUDES}
                      libs/jpegutils/${DIGIKAM_LIBJPEG_DIR})

include_directories(${DK_LOCAL_INCLUDES})
```

There is no need for manual intervention to add new includes, even if you add a new folder, just keep in mind to use:

```
#include "tagmngrlistitem.h"
```

instead of :

```
#include "models/tagmngrlistitem.h"
```

1.8.2.2 Shared Libraries

To avoid linking overhead and make a better use of sources there are some dynamic libs as these one:

- digikamcore : core components used by almost all executables as digiKam and Showfoto.
- digikamdatabase : database components, also used together with digikamcore but only for digiKam

Please add sources to digikam core or digikam database only if they don't depend on any big component from digikam main executable. These two shared libs must be kept small because they link in a lot of places

1.8.2.3 Static Libraries

Currently cmake configuration features a lots of shared libraries as:

- metadataedit
- geolocationedit
- digikamfaceengine

This libraries are linked in digikam main executable and some tests tools.

Avoid making static libraries if possible, and use OBJECT libraries instead. Only make STATIC libraries which does not depend on other digikam code. Also make sure you put the PRIVATE parameter when setting the target_link↩ _libraries.

```
target_link_libraries(digikamcore
                      PRIVATE
                      Qt{QT_VERSION_MAJOR}::Core
                      Qt{QT_VERSION_MAJOR}::Gui
                      Qt{QT_VERSION_MAJOR}::Widgets
)
```

1.8.2.4 Object Libraries

While static libraries are still collection of objects, CMake offer a better approach by allowing to specify an OBJECT library:

```
set(libslideshow_SRCS
    slidetoolbar.cpp
    slideosd.cpp
    slideproperties.cpp
    slideimage.cpp
    slideerror.cpp
    slideend.cpp
    slideshow.cpp
    slidehelp.cpp
    slideshowsettings.cpp
)

add_library(slideshow_src OBJECT ${libslideshow_SRCS})
```

OBJECT library is a cmake internal implementation feature and allow to easily manage sources. Here is an example of how to make a shared lib using OBJECT libraries:

```
add_library(digikamcore
            SHARED
            $<TARGET_OBJECTS:slideshow_src> # the lib we made few lines above
            $<TARGET_OBJECTS:digikamdatabasecore_src>
            $<TARGET_OBJECTS:dimg_src>
            ....
)
```

1.9 Contribute To The Code

This section's purpose is to guide contributors and developers to help on the digiKam project.

1.9.1 Starting With Open-Source

Before to contribute to digiKam project, please take a look to this link which provide 10 golden rules for starting with open source project:

http://schlitt.info/opensource/blog/0541_10_golden_rules_for_starting_↩ with_open_source.html

1.9.2 Source Code Formatting

Adhere to this style guide strictly while adding new code to digiKam or working on existing code.

1.9.2.1 Indentation length

Indent with 4 spaces exactly.

For example:

```
void function()
{
....int a;                          // 4 spaces from beginning
....for (int i = 0 ; i < 10 ; ++i)  // 4 spaces from beginning
....{                               // 4 spaces from beginning
........a = i;                      // 4 spaces from previous indent block
```

Emacs by default will indent to 4 spaces vim users add this to you .vimrc set tabstop=4

1.9.2.2 Tabs vs Spaces

Absolutely no tabs. Use a sensible editor which will convert tabs to spaces. This will reduce unnecessary changes in your git commits.

Emacs by default will convert tab to spaces. For vim users, add this to your .vimrc set expandtab

1.9.2.3 Line length

Line length should never exceed 80 chars (unless really necessary - these cases are rare). Having long lines greatly reduces readability of code

1.9.2.4 Bracketing

In all cases, {} brackets should start on a newline and should be aligned with previous line (follow the indentation spaces). For example.

```
class A
{ //new line
...

for (int i = 0 ; i < 10 ; ++i)
{ //new line

if (a == foobar)
{ //new line
...
}
else
{ // new line
..
}
```

1.9.2.5 Positioning of Access modifiers

public, private, protected, public slots, ... should be aligned to the beginning of the line with no margin

```
class A
{
public: // aligned to left
...
private Q_SLOTS: // aligned to left
```

Follow a consistent order in defining these attributes. The recommended order is public, protected (functions), private (functions), signals, public slots, protected slots, private slots, private (variables)

1.9.3 Class, file and Variable names

1.9.3.1 Class and filenames

- filenames should always be in lower-case
- class names should match the filenames. Capitalize the first letter and other letters logically to improve readability

1.9.3.2 Protected Member variables

- protected member variable names should always be of the form m_varName.
- Capitalize logically so that it becomes easy to read it. Do not capitalize the first letter after _ (Use m_varName not m_VarName)
- variable names should be indicative of their functionality and also of the type they belong too if they are instances of qt widgets. For example, QCheckBox* m_autoRotateCheckBox;

1.9.3.3 Non-Member variables

- non-member variables should follow the same naming convention as the member variables, except for the leading m_

1.9.3.4 Private Member variables

- private member variables must be stored in a d private container to reduce compilation time and improve binary compatibility between digiKam components. See more information how to use a 'd' private class at this url:

  https://community.kde.org/Policies/Library_Code_Policy

1.9.4 Comments and Whitespace

Use whitespaces liberally to improve readability. Add blank lines between logical sections of the code.

Comment as much as possible. Position comments at the beginning of the section/line you want to comment, NEVER at the end of the line, excepted for special cases for ex to describe enum values.

```
// put your comments here
a = (b == foobar) ? 1 : -1;

a = (b == foobar) ? 1 : -1; // you are asking for trouble by putting comments here
```

1.9.5 Header Files

- Add copyright to top of every file. Use the same header than others digiKam source code.
- Add double inclusion protection

```
#pragma once

class AnotherNiceClass
{
...
}
```

- Use forward declarations as much as possible.

```
class QFileInfo;

class A
{
....QFileInfo* m_fileInfo = nullptr;
```

1.9.6 Automatic source code formatting

The above coding style guidelines can be automatically applied with astyle (http://astyle.↩ sourceforge.net/).

Run it in the directory where the files are located that should be formatted.

To apply the coding guidelines with astyle is to use the fileformatter.py script in project/scripts directory. This script will also clean up the source tree and remove backup files that had been created by astyle, if the appropriate command line argument is given.

To handle the command easier, create a bash function in ∼/.bashrc, e.g.

```
dkfrmcode()
{
    astyle --style=allman             \
           --indent=spaces=4          \
           --convert-tabs             \
           --indent-switches          \
           --break-blocks             \
           --break-closing-brackets   \
           --pad-header               \
           --align-pointer=type       \
           --indent-col1-comments     \
           --add-brackets             \
           --min-conditional-indent=0 \
           `find $1 -type f -name '*.cpp'` `find $1 -type f -name '*.c'` `find $1 -type f -name '*.h'`
}
```

You can pass a parameter to the function, in this case the first parameter is the directory, where files should be formatted.

Examples:

1. Run astyle in the current directory
   ```
   $> dkfrmcode
   ```
2. Run astyle in a different directory
   ```
   $> dkfrmcode /home/user/code/git/digikam/
   ```

1.9.7 General recommendations

Please take a look into this contrib page tips before to write code/patches for digiKam project : http↩ ://techbase.kde.org/Contribute

Use the same .cpp/.h header than the rest of digiKam project.

Use a decent editor which does auto-indentation/syntax-highlighting for you, as Kate or QtCreator

There are excellent initializer scripts in the kdesdk package for xemacs and vim which can substantially increase your productivity.

Just to give a taste of what i can do with emacs (and kdesdk):

automatically insert copyright (and ifdefs) in new files. insertion of class function definitions for declared class functions in header with one keystroke switch between header and declaration files with one keystroke go to corresponding definition/declaration with one keystroke tab completion of variable/function names already declared.

1.9.8 GDB Backtrace

If you found a context to crash digiKam, you can provide a backtrace using GDB debugger. digiKam need to be compiled with all debug info else the backtrace will not suitable. There is a configure option for that:

```
$> cmake . -DCMAKE_BUILD_TYPE=debugfull
$> make
$> su
$> make install/fast
```

To make a backtrace with GDB use following command:

```
$ gdb digikam
> catch throw
> run
> ...
> _crash here_
> ...
> bt
> _the backtrace is here_
> quit
```

Post this backtrace at the right place (Bugzilla or development mailing list) for investigation by developers.

For Windows users, take a look on this tutorial :

http://techbase.kde.org/Development/Tutorials/Debugging/Debugging_on_MS_↩Windows

1.9.9 Memory Leak

To check any memory leak problem in digiKam, valgrind is your friend (http://valgrind.org) Try this command line to use with valgrind :

```
valgrind --tool=memcheck --leak-check=full --error-limit=no --suppressions=project/reports/digikam.supp
      digikam
```

NOTE: digikam.supp file is available in digikam/project sub-folder.

1.9.10 Profiling With Cachegrind

Valgrind also includes a tool to find out in which parts of your code time is spent.

```
valgrind --tool=callgrind digikam
```

Profiling can be disabled at startup to limit the output to the code you are interested in. Start with

```
valgrind --tool=callgrind --instr-atstart=no digikam
```

and prepare the situation you want to profile. Then, in another console, start profiling with "callgrind_control -i on" and, after the situation has passed, request a profile dump with "callgrind_control -d". The resulting callgrind.out files need to be viewed with the kcachegrind program, e.g.:

```
kcachegrind callgrind.out.16693.1
```

1.9.11 Unit Testing / Automated Testing

Unit Testing is great way to ensure that software units (in OOP this normally means classes) work as expected. Wikipedia gives a good introduction to Unit Testing:

http://en.wikipedia.org/wiki/Unit_testing

It is also worth to follow most of QTTest API rules with digiKam:

http://doc.qt.io/qt-5/qtest-tutorial.html

The digiKam test suite is located under tests and will be compiled if BUILD_TESTING is turned ON at cmake configuration time. After compiling the source code the tests can be executed via

```
make test
```

The console output while running the tests is stored in Testing/Temporary/LastTest.log in the CMake binary dir.

All tests are simple binaries that can be executed separately if needed.

1.9.12 Checking For Corrupt Qt Signal Slot Connection

Use this alias for running digikam:

```
alias digikamdbg="digikam 2>&1 | tee - /tmp/digikam.out; echo -e \"\n\n\nPossible connection errors:\n\n\";
      cat /tmp/digikam.out | grep -A2 'Object::connect'"
```

It will print a list of connection warnings after terminating the program. Moreover the complete console log of the last session is stored in /tmp/digikam.out.

1.9.13 Finding Duplicated Code

Code duplication should be avoided as bugs have to be fixed for every piece of duplicated code. The current duplication can be analyzed eg. with Simian: http://www.redhillconsulting.com.↩au/products/simian/

In the digikam checkout directory run:

```
java -jar simian.jar `find . -regex '.*\.cpp\|.*\.h' | grep -v 3rdparty`
```

This prints out a list of duplicated code segments.

1.9.14 API Documentation Validation, User Documentation Validation, Source Code Checking

The following site check on a daily basis for the a.m. errors: www.englishbreakfastnetwork.org/krazy/

It can be very useful, in particular before major releases. Don't trust it blindly! Sometimes they propose too advanced modifications that are no compatible with the prevailing include files.

1.9.15 Usability Issues

OpenUsability project has define default menu structure and keyboard shortcuts:

http://wiki.openusability.org/guidelines/index.php/Appendices:Keyboard_↩Shortcuts

1.9.16 Generate API Documentation

To generate API documentation, you need to install:

- Doxygen program (http://www.doxygen.org)
- Dot program (http://www.graphviz.org)
- TeXLive package full version to generate the API doc in PDF (https://tug.org/texlive/)

Under Ubuntu run:

```
sudo apt install doxygen graphviz texlive-full
```

After cmake generated a Makefile you can call 'make doc'. A new subfolder named 'html' will be created. Warning, this can take a while.

For finding documentation errors, doxygen generates a warning log file at the cmake binary dir called 'doxygen-warn.log'.

1.9.17 Speed Up The Code-Compile-Test Cycle

Assuming you have setup your environment in ∼/.bashrc as is suggested for development, you can add something like this to your ∼/.bashrc:

```
function digikam_start
{
LD_LIBRARY_PATH=${KDE_BUILD}/extragear/graphics/lib:${LD_LIBRARY_PATH}
      ${KDE_BUILD}/extragear/graphics/digikam/digikam/digikam
}

function digikam_start_gdb
{
LD_LIBRARY_PATH=${KDE_BUILD}/extragear/graphics/lib:${LD_LIBRARY_PATH} gdb
      ${KDE_BUILD}/extragear/graphics/digikam/digikam/digikam
}
```

This allows you to run digikam after compiling without the need of a "make install", even if you changed code in the libraries.

1.9.18 Working With Branches From Git Repository

Example to create a local 'dplugins' development branch based on master:

```
git checkout master
git checkout -b development/dplugins
```

Example to delete the local 'dplugins' development branch:

```
git checkout master
git branch -d development/dplugins
```

Example to create a remote 'dplugins' development branch from the local branch:

```
git push -u origin development/dplugins
```

Example to delete the remote 'dplugins' development branch:

```
git push origin :development/dplugins
```

1.9.19 Sync a Branch With Master From Git Repository

It typical to use a dedicated development branch in Git to keep the master code stable for production. To synchronize branches with master, use these commands in your local branch checkout:

```
$>git checkout master
$>git pull --rebase
$>git checkout -b MY_DEVEL_BRANCH GIT_REMOTE_PATH
  Branch 'MY_DEVEL_BRANCH' set up to track remote branch path 'GIT_REMOTE_PATH' from origin.
  To list GIT_REMOTE_PATH, use 'git branch -a' command
  Switched to a new branch 'MY_DEVEL_BRANCH'
$>git merge master
  Merge made by the 'recursive' strategy.
  ...
$>git push
  ...
```

The first 2 lines make sure that your local master repository is up to date. The 3rd line creates the local development branch "MY_DEVEL_BRANCH". If you have already created this branch, just run "git checkout MY_DEVEL_↩ BRANCH". Merging between master and "MY_DEVEL_BRANCH" branch is done in the 4th line. Git might ask you to resolve conflicts here. When it's done, it will ask you to provide a commit message. Finally you push your merge into the remote repository.

5.1.2 Typedef Documentation

5.1.2.1 ActionJobCollection

```
typedef QHash<ActionJob*, int> Digikam::ActionJobCollection
```

Priority value can be used to control the run queue's order of execution. Zero priority want mean to process job with higher priority.

5.1.2.2 DItemsListIsLessThanHandler

```
typedef bool(* Digikam::DItemsListIsLessThanHandler) (const QTreeWidgetItem *current, const
QTreeWidgetItem &other)
```

Sort items call this method in DItemsListViewItem::operator<. To setup this method, uses DItemList::setIsLess↩ ThanHandler().

5.1.3 Enumeration Type Documentation

5.1.3.1 DetectorNNModel

```
enum Digikam::DetectorNNModel
```

FS_EDITOR	Image Editor Config.
FS_LIGHTTABLE	Light Table Config.
FS_IMPORTUI	Import UI Config.

5.1.3.3 GeoGroupStateEnum

```
enum Digikam::GeoGroupStateEnum
```

The idea is that a group consists of more than one object. Thus the resulting state is that either none of the objects, some or all of them have a certain state. The constants for each state are set up such that they can be logically or'ed: If a group has the state ___All, and another the state ___Some, the bit representing ___Some is always

propagated along. You only have to make sure that once you reach an object with ___None, and the computed state is ___All, to set the ___Some bit.

Selected___: An object is selected. FilteredPositive___: An object was highlighted by a filter. This usually means that not-positively-filtered objects should be hidden. RegionSelected___: An object is inside a region of interest on the map.

5.1.3.4 HistogramRenderingType

Enumerator

ParentToChild	Edges are directed from a parent to its child.
ChildToParent	Edges are direct from a child to its parent.

5.1.3.11 OperationType

5.1.4 Function Documentation

5.1.4.1 _cmsAdaptationMatrix()

```
cmsBool Digikam::_cmsAdaptationMatrix (
            cmsMAT3 *const r,
            const cmsMAT3 * ConeMatrix,
            const cmsCIEXYZ *const FromIll,
            const cmsCIEXYZ *const ToIll )
```

Returns

The final chromatic adaptation from illuminant FromIll to Illuminant ToIll The cone matrix can be specified in ConeMatrix. If NULL, Bradford is assumed

5.1.4.2 _cmsAdaptMatrixToD50()

```
static cmsBool Digikam::_cmsAdaptMatrixToD50 (
            cmsMAT3 *const r,
            const cmsCIExyY *const SourceWhitePt )  [static]
```

White point is given in xyY

5.1.4.3 _cmsBuildRGB2XYZtransferMatrix()

```
cmsBool Digikam::_cmsBuildRGB2XYZtransferMatrix (
            cmsMAT3 *const r,
            const cmsCIExyY *const WhitePt,
            const cmsCIExyYTRIPLE *const Primrs )
```

The algorithm:

```
- First I build the absolute conversion matrix using
  primaries in XYZ. This matrix is next inverted.
- Then I evaluate the source white point across this matrix
  obtaining the coefficients of the transformation.
- Then, I apply these coefficients to the original matrix.
```

5.1.4.4 adjustedEnvironmentForAppImage()

```
QProcessEnvironment Digikam::adjustedEnvironmentForAppImage ( )
```

Use case : system based Hugin CLI tools called by Panorama wizard. If digiKam do not run as AppImage bundle, this method return a QProcessEnvironment instance based on system environment.

5.1.4.5 cmsAdaptMatrixFromD50()

```
static cmsBool Digikam::cmsAdaptMatrixFromD50 (
            cmsMAT3 *const r,
            const cmsCIExyY *const DestWhitePt )  [static]
```

White point is given in xyY

5.1.4.6 coordinatesToClipboard()

```

            const GeoCoordinates & coordinates,
            const QUrl & url,
            const QString & title )
```

NOTE: importing this representation into Marble does not show anything, but Merkaartor shows the point

importing this data into Marble and Merkaartor works

5.1.4.7 delayForRemoteDebuging()

```
void Digikam::delayForRemoteDebuging (
            int delaySecs = 30 )

            LPMAT3 r,
            LPcmsCIExyY DestWhitePt )
```

Returns

The final chromatic adaptation from illuminant FromIll to Illuminant ToIll The cone matrix can be specified in ConeMatrix. If null, assuming D50 source. White point is given in xyY

These images are based on the TIFF image standard.

For these models: Kodak DSC Pro SLR/c, Kodak DSC Pro SLR/n, Kodak DSC Pro 14N, Kodak DSC PRO 14nx.

DNG is publicly available archival format for the raw files generated by digital cameras. By addressing the lack of an open standard for the raw files created by individual camera models, DNG helps ensure that photographers will be able to access their files in the future.

For DSC-F828 8 megapixel digital camera or Sony DSC-R1.

For devices based on Foveon X3 direct image sensor.

For Alpha devices.

```
const double Digikam::spectral_chromaticity[81][3]  [static]

This table is used in conjunction with Planck's law for the energy spectrum of a black body at a given temperature to plot the black body curve on the CIE chart.

The following table gives the spectral chromaticity coordinates $x(\lambda)$ and $y(\lambda)$ for wavelengths in 5 nanometer increments from 380 nm through 780 nm. These coordinates represent the position in the CIE x-y space of pure spectral colors of the given wavelength, and thus define the outline of the CIE "tongue" diagram.

5.2 Digikam::Matrix Namespace Reference

If the picture is displayed according to the exif orientation tag, the user will request rotating operations relative to what he sees, and that is the picture rotated according to the EXIF tag.

Functions

- MetaEngineRotation **matrix** (MetaEngine::ImageOrientation exifOrientation)
- MetaEngineRotation **matrix** (MetaEngineRotation::TransformationAction action)

Variables

- static const MetaEngineRotation **flipHorizontal** (-1, 0, 0, 1)
- static const MetaEngineRotation **flipVertical** (1, 0, 0, -1)
- static const MetaEngineRotation **identity** (1, 0, 0, 1)
- static const MetaEngineRotation **rotate180** (-1, 0, 0, -1)
- static const MetaEngineRotation **rotate270** (0, -1, 1, 0)
- static const MetaEngineRotation **rotate90** (0, 1, -1, 0)
- static const MetaEngineRotation **rotate90flipHorizontal** (0, 1, 1, 0)

  first rotate, then flip
- static const MetaEngineRotation **rotate90flipVertical** (0, -1, -1, 0)

  first rotate, then flip

5.2.1 Detailed Description

So the operation requested and the given EXIF angle must be combined. E.g. if orientation is "6" (rotate 90 clockwiseto show correctly) and the user selects 180 clockwise, the operation is 270. If the user selected 270, the operation would be None (and clearing the exif tag).

This requires to describe the transformations in a model which cares for both composing (180+90=270) and eliminating (180+180=no action), as well as the non-commutative nature of the operations (vflip+90 is not 90+vflip)

All 2D transformations can be described by a 2x3 matrix, see QWMetaEngineRotation. All transformations needed here - rotate 90, 180, 270, flipV, flipH - can be described in a 2x2 matrix with the values 0,1,-1 (because flipping is expressed by changing the sign only, and sine and cosine of 90, 180 and 270 are either 0,1 or -1).

x' = m11 x + m12 y y' = m21 x + m22 y

Moreover, all combinations of these rotate/flip operations result in one of the eight matrices defined below. This did not proof that mathematically, but empirically.

6.3.1 Detailed Description

This class enables various utility functions like selecting albums on mouse actions or providing an infrastructure for displaying a context menu for albums.

Context menu handling is implemented as template methods with hook methods that can be implemented by subclasses to provide a custom behavior. In default mode no context menu is shown at all. It must be enabled via a call to setEnableContextMenu.

6.3.2 Member Enumeration Documentation

6.3.2.1 Flag

```
enum Digikam::AbstractAlbumTreeView::Flag
```

Enumerator

CreateDefaultModel	Create a default model. Not supported by abstract classes. Not part of default flags!
CreateDefaultFilterModel	Create a default filter model.
CreateDefaultDelegate	Create a delegate which paints according to settings. If not set, the Qt default delegate of the view is used.
ShowCountAccordingToSettings	Show the count according to the settings. If not set, call setShowCount() on the model yourself.
AlwaysShowInclusiveCounts	Always show the inclusive counts. Not part of default flags!

6.3.3 Constructor & Destructor Documentation

6.3.3.1 AbstractAlbumTreeView()

```
Digikam::AbstractAlbumTreeView::AbstractAlbumTreeView (
            QWidget *const parent,
            Flags flags )
```

If you give 0 for model, call setAlbumModel afterwards. If you supply 0 for filterModel, call setAlbumFilterModel afterwards.

6.3.4 Member Function Documentation

6.3.4.1 addCustomContextMenuActions()

```
void Digikam::AbstractAlbumTreeView::addCustomContextMenuActions (
            ContextMenuHelper & cmh,
            Album * album )  [protected], [virtual]
```

Parameters

cmh	helper object to create the context menu
album	tag on which the context menu will be created. May be null if it is requested on no tag entry

Reimplemented in Digikam::TagFilterView, Digikam::AlbumSelectTreeView, Digikam::TagCheckView, Digikam::TagFolderView, Digikam::EditableSearchTreeView, and Digikam::NormalSearchTreeView.

6.3.4.2 contextMenuIcon()

```
QPixmap Digikam::AbstractAlbumTreeView::contextMenuIcon ( ) const  [protected], [virtual]
```

Returns

the icon for the context menu

6.3.4.3 contextMenuTitle()

```
QString Digikam::AbstractAlbumTreeView::contextMenuTitle ( ) const  [protected], [virtual]
```

Returns

title for the context menu

Reimplemented in Digikam::TagFolderView, and Digikam::EditableSearchTreeView.

6.3.4.4 doLoadState()

```
void Digikam::AbstractAlbumTreeView::doLoadState ( )  [override], [virtual]
```

Therefore the config is first parsed into d->statesByAlbumId which holds the state of all tree view entries indexed by album id. Afterwards an initial sync run is done restoring the state of all model entries that are already present at this time. Every processed entry is removed from d->statesByAlbumId. If there are still entries left in this map we assume that the model is not fully loaded at the moment. Therefore the rowsInserted signal is connected to a slot that restores the state of new rows based on the remaining entries in d->statesByAlbumId.

Implements Digikam::StateSavingObject.

Reimplemented in Digikam::AbstractCheckableAlbumTreeView, and Digikam::TagCheckView.

6.3.4.5 doSaveState()

```
void Digikam::AbstractAlbumTreeView::doSaveState ( )  [override], [virtual]
```

Use getConfigGroup() and entryName() for the implementation.

Implements Digikam::StateSavingObject.

Reimplemented in Digikam::AbstractCheckableAlbumTreeView, and Digikam::TagCheckView.

6.3.4.6 expandEverything

```
void Digikam::AbstractAlbumTreeView::expandEverything (
            const QModelIndex & index )  [slot]
```

Parameters

index	the index to start expanding everything

6.3.4.7 expandMatches()

```
bool Digikam::AbstractAlbumTreeView::expandMatches (
            const QModelIndex & index )
```

Parameters

index	the index to start ensuring expansion state

Returns

`true` if there was a match under `index`. This return value can normally be ignored by the caller because it is only used for an internal recursion.

6.3.4.8 handleCustomContextMenuAction()

```
void Digikam::AbstractAlbumTreeView::handleCustomContextMenuAction (
            QAction * action,
            const AlbumPointer< Album > & album )  [protected], [virtual]
```

Parameters

action	the action that was chosen by the user, may be null if none of the custom actions were selected
album	the tag on which the context menu was requested. May be null if there was no

Reimplemented in Digikam::TagFilterView, Digikam::AlbumSelectTreeView, Digikam::TagFolderView, Digikam::EditableSearchTreeVie and Digikam::NormalSearchTreeView.

6.3.4.9 indexVisuallyAt()

```
QModelIndex Digikam::AbstractAlbumTreeView::indexVisuallyAt (
            const QPoint & p )
```

Parameters

p	must be in the viewport currently. Decoration will not be included. Suitable for mouse click positions.

6.3.4.10 pixmapForDrag()

```
QPixmap Digikam::AbstractAlbumTreeView::pixmapForDrag (
            const QStyleOptionViewItem & option,
            QList< QModelIndex > indexes )  [protected], [virtual]
```

6.3.4.11 selectedAlbumsChanged

```
void Digikam::AbstractAlbumTreeView::selectedAlbumsChanged (
            const QList< Album * > & selectedAlbums )  [signal]
```

Use currentChanged unless in multi-selection mode.

6.3.4.12 selectedItems()

```
QList< Album * > Digikam::AbstractAlbumTreeView::selectedItems ( )
```

Returns

selected Items

6.3.4.13 setAlbumFilterModel()

```
void Digikam::AbstractAlbumTreeView::setAlbumFilterModel (
            AlbumFilterModel *const filterModel )  [protected], [virtual]
```

Note

When only single selection was available, everything was implemented using currentAlbum() which was equal with selectedAlbum() after enabling multiple selection they are no longer the same and some options must use selected others only currentAlbum Now AlbumManager implementation is a little bit of mess because selected are now currentAlbums().

6.3.4.14 setAlbumManagerCurrentAlbum()

```
void Digikam::AbstractAlbumTreeView::setAlbumManagerCurrentAlbum (
            const bool setCurrentAlbum )
```

Other treeview are self-contained and shall not change the current album. Default: false

6.3.4.15 setContextMenuIcon()

```
void Digikam::AbstractAlbumTreeView::setContextMenuIcon (
            const QPixmap & pixmap )
```

This is used by the default implementation of contextMenuIcon() and contextMenuTitle(). You can alternatively reimplement these methods.

6.3.4.16 setCurrentAlbums

```
void Digikam::AbstractAlbumTreeView::setCurrentAlbums (
            const QList< Album * > & albums,
            bool selectInAlbumManager = true )  [slot]
```

Parameters

albums	the albums to select
selectInAlbumManager	the album will be set as current album, if both this parameter is true and setAlbumManagerCurrentAlbum() was set to true.

6.3.4.17 setEnableContextMenu()

```
void Digikam::AbstractAlbumTreeView::setEnableContextMenu (
            const bool enable )
```

More detailed decision at which position a menu can be shown and where not can be made by implementing showContextMenuAt.

Parameters

enable	if true, a context menu can be shown

6.3.4.18 setSelectAlbumOnClick()

```
void Digikam::AbstractAlbumTreeView::setSelectAlbumOnClick (
            const bool selectOnClick )
```

Parameters

selectOnClick	if true, a click on an item automatically sets this item as the current album in the album manager

6.3.4.19 setSelectOnContextMenu()

```
void Digikam::AbstractAlbumTreeView::setSelectOnContextMenu (
            const bool select )
```

Defaults to true.

Parameters

select	true if a context menu request shall select the album

6.3.4.20 showContextMenuAt()

```
bool Digikam::AbstractAlbumTreeView::showContextMenuAt (

```
void Digikam::AbstractAlbumTreeViewSelectComboBox::addCheckUncheckContextMenuActions ( )
```

Call this method after setModel().

6.5.2.2 installView()

```
void Digikam::AbstractAlbumTreeViewSelectComboBox::installView (

- bool **m_restoreCheckState** = false

6.7.1 Constructor & Destructor Documentation

6.7.1.1 AbstractCheckableAlbumTreeView()

```
Digikam::AbstractCheckableAlbumTreeView::AbstractCheckableAlbumTreeView (
            QWidget *const parent,
            Flags flags )  [explicit]
```

Note

Models of these view *can* be checkable, they need *not*. You need to enable it on the model.

6.7.2 Member Function Documentation

6.7.2.1 doLoadState()

```
void Digikam::AbstractCheckableAlbumTreeView::doLoadState ( )  [override], [virtual]
```

Therefore the config is first parsed into d->statesByAlbumId which holds the state of all tree view entries indexed by album id. Afterwards an initial sync run is done restoring the state of all model entries that are already present at this time. Every processed entry is removed from d->statesByAlbumId. If there are still entries left in this map we assume that the model is not fully loaded at the moment. Therefore the rowsInserted signal is connected to a slot that restores the state of new rows based on the remaining entries in d->statesByAlbumId.

Reimplemented from Digikam::AbstractAlbumTreeView.

Reimplemented in Digikam::TagCheckView.

6.7.2.2 doSaveState()

```
void Digikam::AbstractCheckableAlbumTreeView::doSaveState ( )  [override], [virtual]
```

Use getConfigGroup() and entryName() for the implementation.

Reimplemented from Digikam::AbstractAlbumTreeView.

Reimplemented in Digikam::TagCheckView.

6.7.2.3 isRestoreCheckState()

```
bool Digikam::AbstractCheckableAlbumTreeView::isRestoreCheckState ( ) const
```

Returns

true if restoring check state is active

6.7.2.4 middleButtonPressed()

```
void Digikam::AbstractCheckableAlbumTreeView::middleButtonPressed (
            Album * a )  [override], [protected], [virtual]
```

Reimplemented from Digikam::AbstractAlbumTreeView.

6.7.2.5 setRestoreCheckState()

```
void Digikam::AbstractCheckableAlbumTreeView::setRestoreCheckState (
            bool restore )
```

Parameters

restore	if true, restore check state

6.11.1.1 accepts()

```
Qt::DropAction Digikam::AbstractItemDragDropHandler::accepts (
            const QDropEvent * e,
            const QModelIndex & dropIndex )  [virtual]
```

Returns the proposed action, or Qt::IgnoreAction if not accepted.

6.11.1.2 acceptsMimeData()

```
bool Digikam::AbstractItemDragDropHandler::acceptsMimeData (
            const QMimeData * data )  [virtual]
```

acceptsMimeData shall return true if a drop of the given mime data will be accepted on any index or place at all. If this returns false, the more specific method accepts() will not be called for this drag. The default implementation uses mimeTypes() to check for supported mime types. There is usually no need to reimplement this.

6.11.1.3 createMimeData()

```
QMimeData * Digikam::AbstractItemDragDropHandler::createMimeData (
            const QList< QModelIndex > &  )  [virtual]

            const QDropEvent * e,
            const QModelIndex & droppedOn )  [virtual]
```

The index is the index where the drop was dropped on. It may be invalid (dropped on decoration, viewport) Returns true if the event is to be accepted.

Reimplemented in Digikam::ImportDragDropHandler, Digikam::ItemDragDropHandler, and ShowFoto::ShowfotoDragDropHandler.

6.11.1.5 mimeTypes()

```
QStringList Digikam::AbstractItemDragDropHandler::mimeTypes ( ) const  [virtual]
```

```
void Digikam::Album::setExtraData (
            const void *const key,
            void *const value )

As one Album can be used by several objects (often views) which all need to add some data, you have to use a key to reference your extra data within the Album.

That way a Album can hold and provide access to all those views separately.

for eg,
```
album->setExtraData( this, searchFolderItem );
```

and can later access the searchFolderItem by doing
```
SearchFolderItem *item = static_cast<SearchFolderItem*>(album->extraData(this));
```

Note: you have to remove and destroy the data you associated yourself when you don't need it anymore!

Parameters

key	the key of the extra data
value	the value of the extra data

6.50.1 Member Enumeration Documentation

6.50.1.1 FilterBehavior

```
enum Digikam::AlbumFilterModel::FilterBehavior
```

Enumerator

SimpleFiltering	If an index does not matched, the index and all its children are filtered out. This is the Qt default behavior, but undesirable for album trees.
FullFiltering	Default behavior. If an index matches, it is shown, which directly means all its parents are shown as well. In addition, all its children are shown as well.
StrictFiltering	If an index matches, it is shown, which directly means all its parents are shown as well. Its children are not shown unless they also match.

6.50.1.2 MatchResult

```
enum Digikam::AlbumFilterModel::MatchResult
```

Enumerator

NoMatch	This enum can be used as a boolean value if match/no match only is needed.
DirectMatch	The index itself is matched.
ParentMatch	A parent if the index is matched.
ChildMatch	A child of the index is matched.
SpecialMatch	The index is matched not because of search settings, but because it has a special type.

6.50.2 Member Function Documentation

6.50.2.1 hasSearchResult

```
void Digikam::AlbumFilterModel::hasSearchResult (
            bool hasResult ) [signal]
```

Parameters

hasResult	`true` if the new filter matches any album, else `false`

6.50.2.2 isFiltering()

```
bool Digikam::AlbumFilterModel::isFiltering ( ) const [virtual]
```

Returns

`true` if the current selected filter could result in any filtering without checking if this really happens.

Reimplemented in Digikam::CheckableAlbumFilterModel, Digikam::SearchFilterModel, and Digikam::TagPropertiesFilterModel.

6.50.2.3 lessThan()

```
bool Digikam::AlbumFilterModel::lessThan (
            const QModelIndex & left,
            const QModelIndex & right ) const [override], [protected]
```

Implementation to sort Tags that contain Unconfirmed Faces, according to the Unconfirmed Face Count.

6.50.2.4 matches()

```
bool Digikam::AlbumFilterModel::matches (
            Album * album ) const [protected], [virtual]
```

Return true if this single album matches the current criteria. This method can be overridden to provide custom filtering.

Parameters

album	the album to tell if it matches the filter criteria or not.

Reimplemented in Digikam::CheckableAlbumFilterModel, Digikam::SearchFilterModel, Digikam::TagPropertiesFilterModel, and Digikam::TagsManagerFilterModel.

6.50.2.5 matchResult() [1/2]

```
AlbumFilterModel::MatchResult Digikam::AlbumFilterModel::matchResult (
            Album * album ) const [protected]
```

An album matches if the search text settings are found in a parent album's title, in the album's title or in a child album's title, or if it is a special album (root) that is never filtered out.

6.50.2.6 matchResult() [2/2]

```
AlbumFilterModel::MatchResult Digikam::AlbumFilterModel::matchResult (
            const QModelIndex & index ) const
```

Never returns NoMatch for a valid index, because in this case, the index would rather be filtered out.

6.50.2.7 searchTextSettings()

```
SearchTextSettings Digikam::AlbumFilterModel::searchTextSettings ( ) const
```

Returns

current settings for filtering.

6.50.2.8 searchTextSettingsAboutToChange

```
void Digikam::AlbumFilterModel::searchTextSettingsAboutToChange (
            bool searched,
            bool willSearch )  [signal]
```

Parameters

searched	`true` if filtering by text was enabled before applying the new settings
willSearch	`true` if the new settings can result in any filtering by text, else `false`.

6.50.2.9 searchTextSettingsChanged

```
void Digikam::AlbumFilterModel::searchTextSettingsChanged (
            bool wasSearching,
            bool searched )  [signal]
```

Parameters

wasSearching	`true` if this is not a new search that
searched	`true` if the new settings result in any filtering

6.50.2.10 setFilterBehavior()

```
void Digikam::AlbumFilterModel::setFilterBehavior (
            FilterBehavior behavior )
```

Default is FullFiltering.

6.50.2.11 setSearchTextSettings

```
void Digikam::AlbumFilterModel::setSearchTextSettings (
            const SearchTextSettings & settings )  [slot]
```

Parameters

settings	new settings to apply. An empty text will be interpreted as no filtering

6.50.2.12 setSourceAlbumModel()

```
void Digikam::AlbumFilterModel::setSourceAlbumModel (
            AbstractAlbumModel *const source )
```

Note: If a chained filter model is set, it will not be reset, but the source album model will be made source of the chained filter model.

6.50.2.13 setSourceFilterModel()

```
void Digikam::AlbumFilterModel::setSourceFilterModel (
            AlbumFilterModel *const source )
```

Note: If a direct source album model is set as current source, it will be set as sourceAlbumModel of the new source filter model.

6.50.2.14 setSourceModel()

```
void Digikam::AlbumFilterModel::setSourceModel (
            QAbstractItemModel *const model )  [override], [protected]
```

6.56.1 Detailed Description

For PAlbums and TAlbums, the listing is done by reading the db directly and building the hierarchy of the albums. For DAlbums, since the listing takes time, the work is delegated to a dbjob. Interested frontend entities can connect to the albummanager to receive notifications of new Albums, when Albums are deleted and when the current album is changed.

Additional operations are provided for: creating/deleting/rename Albums, updating icons and moving Albums.

```
PAlbum * Digikam::AlbumManager::createPAlbum (
            const CollectionLocation & location,

            const QString & category,
            QString & errMsg )
```

Here you can supply a collection location (which must be available).

Parameters

6.58.1 Member Function Documentation

6.58.1.1 accepts()

```
Qt::DropAction Digikam::AlbumModelDragDropHandler::accepts (
            const QDropEvent * e,
            const QModelIndex & dropIndex )  [virtual]
```

Returns the proposed action, or Qt::IgnoreAction if not accepted.

Reimplemented in Digikam::AlbumDragDropHandler, and Digikam::TagDragDropHandler.

6.58.1.2 acceptsMimeData()

```
bool Digikam::AlbumModelDragDropHandler::acceptsMimeData (
            const QMimeData * data )  [virtual]
```

acceptsMimeData shall return true if a drop of the given mime data will be accepted on any index or place at all. If this returns false, the more specific method accepts() will not be called for this drag. The default implementation uses mimeTypes() to check for supported mime types. There is usually no need to reimplement this.

6.58.1.3 createMimeData()

```
QMimeData * Digikam::AlbumModelDragDropHandler::createMimeData (
            const QList< Album * > &  )  [virtual]
```

Reimplemented in Digikam::AlbumDragDropHandler, and Digikam::TagDragDropHandler.

6.58.1.4 dropEvent()

```
bool Digikam::AlbumModelDragDropHandler::dropEvent (
            QAbstractItemView * view,
            const QDropEvent * e,
            const QModelIndex & droppedOn )  [virtual]
```

The index is the index where the drop was dropped on. It may be invalid (dropped on decoration, viewport) Returns true if the event is to be accepted.

Reimplemented in Digikam::AlbumDragDropHandler, and Digikam::TagDragDropHandler.

6.58.1.5 mimeTypes()

```
QStringList Digikam::AlbumModelDragDropHandler::mimeTypes ( ) const  [virtual]
```

Called by the default implementation of model's mimeTypes().

Reimplemented in Digikam::AlbumDragDropHandler, and Digikam::TagDragDropHandler.

6.78.1 Member Enumeration Documentation

6.78.1.1 RelativeSize

```
enum Digikam::AlbumThumbnailLoader::RelativeSize
```

Some widgets use smaller icons than other widgets. These widgets do not need to know the currently set icon size from the setup and calculate a smaller size, but can simply request a relatively smaller icon. Depending on the user-chosen icon size, this size may in fact not be smaller than the normal size.

6.78.2 Member Function Documentation

6.78.2.1 getAlbumThumbnail()

```
bool Digikam::AlbumThumbnailLoader::getAlbumThumbnail (
            PAlbum *const album )
```

The thumbnail will be loaded and returned asynchronously by the signals. If no thumbnail is associated with given album, no action will be taken, and false is returned.

6.78.2.2 getAlbumThumbnailDirectly()

```
QPixmap Digikam::AlbumThumbnailLoader::getAlbumThumbnailDirectly (
            PAlbum *const album )
```

If the icon is not yet loaded, it will be returned asynchronously by the signals, and a default icon is returned here. If no icon is associated, the default icon is returned.

6.78.2.3 getStandardTagIcon()

```
QPixmap Digikam::AlbumThumbnailLoader::getStandardTagIcon (
            RelativeSize size = NormalSize )
```

The third methods check if album is the root, and returns the standard icon or the root standard icon.

6.78.2.4 getTagThumbnail()

```
bool Digikam::AlbumThumbnailLoader::getTagThumbnail (
            TAlbum *const album,
            QPixmap & icon )
```

Tag thumbnails will be processed as appropriate. Tags may have associated an icon that is loaded synchronously by the system icon loader. In this case, icon is set to this icon, and false is returned. If no icon is associated with the tag, icon is set to null, and false is returned. If a custom icon is associated with the tag, it is loaded asynchronously, icon is set to null, and true is returned. Tag thumbnails are always smaller than album thumbnails - as small as an album thumbnail with SmallerSize. They are supposed to be blended into the standard tag icon obtained below, or used as is when SmallerSize is requested anyway.

Returns

Returns true if icon is loaded asynchronously.

6.78.2.5 getTagThumbnailDirectly()

```
QPixmap Digikam::AlbumThumbnailLoader::getTagThumbnailDirectly (
            TAlbum *const album )
```

If the icon is not yet loaded, it will be returned asynchronously by the signals (unblended), and a default icon is returned here. If no icon is associated, the default icon is returned.

6.78.2.6 setThumbnailSize()

```
void Digikam::AlbumThumbnailLoader::setThumbnailSize (
            int size,
            int face )
```

If the size differs from the current size, signalReloadThumbnails will be emitted.

6.78.2.7 signalFailed

```
void Digikam::AlbumThumbnailLoader::signalFailed (
            Album * album )  [signal]
```

Same considerations as above.

6.78.2.8 signalReloadThumbnails

```
void Digikam::AlbumThumbnailLoader::signalReloadThumbnails ( )  [signal]
```

This is usually because the icon size has changed in the setup.

6.78.2.9 signalThumbnail

```
void Digikam::AlbumThumbnailLoader::signalThumbnail (
            Album * album,
            const QPixmap &  )  [signal]
```

Size of image can be passed as argument. This signal is emitted as soon as a thumbnail has become available for given album. This class is a singleton, so any object connected to this signal might not actually have requested a thumbnail for given url

- bool **runningFlag** () const volatile

  In you run() method, you shall regularly check for runningFlag() and cleanup and return if false.
- virtual void shutDown ()

  If you are deleting data in your destructor which is accessed from the thread, do one of the following from your destructor to guarantee a safe shutdown: 1) Call this method 2) Call stop() and wait(), knowing that nothing will call start() anymore after this 3) Be sure the thread will never be running at destruction.
- void start (QMutexLocker< QMutex > &locker)

  Doing the same as start(), stop() and wait above, provide it with a locked QMutexLocker on mutex().
- void **stop** (const QMutexLocker< QMutex > &locker)
- QMutex * threadMutex () const

  This is the non-recursive mutex used to protect state variables and waiting in this class.

6.92.1 Member Function Documentation

6.92.1.1 checkIndex()

```
bool Digikam::AssignNameOverlay::checkIndex (
            const QModelIndex & index ) const  [override], [protected], [virtual]
```

Returns

true here if you want to show the overlay for the given index. The default implementation returns true.

Reimplemented from Digikam::AbstractWidgetDelegateOverlay.

6.92.1.2 createWidget()

```
QWidget * Digikam::AssignNameOverlay::createWidget ( )  [override], [protected], [virtual]
```

When creating the object, pass parentWidget() as parent widget. Ownership of the object is passed. It will be deleted in setActive(false).

Implements Digikam::AbstractWidgetDelegateOverlay.

6.92.1.3 setActive()

```
void Digikam::AssignNameOverlay::setActive (
            bool active )  [override], [protected], [virtual]
```

If active is false, this will delete the widget and disconnect all signal from model and view to this object (!)

Reimplemented from Digikam::AbstractWidgetDelegateOverlay.

6.92.1.4 setFocusOnWidget()

```
void Digikam::AssignNameOverlay::setFocusOnWidget ( )  [override], [protected], [virtual]
```

Default implementation sets focus on widget()

Reimplemented from Digikam::PersistentWidgetDelegateOverlay.

6.92.1.5 showOnIndex()

```
void Digikam::AssignNameOverlay::showOnIndex (
            const QModelIndex & index )  [override], [protected], [virtual]
```

slotEntered()

Reimplemented from Digikam::PersistentWidgetDelegateOverlay.

6.92.1.6 updateFace()

```
void Digikam::AssignNameOverlay::updateFace ( )  [protected]
```

The order to plug these functions is important, since setUserData() controls how the Overlay appears on a particular face.

6.92.1.7 viewportLeaveEvent()

```
void Digikam::AssignNameOverlay::viewportLeaveEvent (
            QObject * obj,
            QEvent * event )  [override], [protected], [virtual]
```

6.93.1 Member Function Documentation

6.93.1.1 assigned

```
void Digikam::AssignNameWidget::assigned (
            const TaggingAction & action,
            const ItemInfo & info,
            const QVariant & faceIdentifier )  [signal]
```

This can be an existing tag, or a new tag, as described by TaggingAction. For convenience, info() and faceIdentifier() are provided.

6.93.1.2 rejected

```
void Digikam::AssignNameWidget::rejected (
            const ItemInfo & info,
            const QVariant & faceIdentifier )  [signal]
```

For convenience, info() and faceIdentifier() are provided.

6.93.1.3 selected

```
void Digikam::AssignNameWidget::selected (
            const TaggingAction & action,
            const ItemInfo & info,
            const QVariant & faceIdentifier )  [signal]
```

This purely signals user interaction, no fixed decision - mouse hover may be enough to emit this signal. The action may be invalid (user switched back to empty selection).

6.93.1.4 setMode()

```
void Digikam::AssignNameWidget::setMode (
            Mode mode )
```

Reject tooltip and icon should be updated even if the same mode is passed, because Unconfirmed and Unknown. Faces have the same mode but different tooltips and icons.

6.93.1.5 setUserData

```
void Digikam::AssignNameWidget::setUserData (
            const ItemInfo & info,
            const QVariant & faceIdentifier = QVariant() )  [slot]
```

Ignored faces are drawn over with a different overlay, as Reject button should be disabled.

QString Digikam::BatchTool::outputSuffix ( ) const  [virtual]
```

Typically, this is used with tool which convert to new file format. This method return and empty string by default.

6.120.3.7 registerSettingsWidget()

```
void Digikam::BatchTool::registerSettingsWidget ( )  [virtual]
```

Default implementation assign no settings view (a message label is just displayed). You need to call default implementation in your child class to init default signals and slots connections, after to have instanced your dedicated settings widget.

6.120.3.8 savefromDImg()

```
bool Digikam::BatchTool::savefromDImg ( ) const
```

- output Url set by setOutputUrl() or setOutputUrlFromInputUrl()
- output file format set by outputSuffix(). If this one is empty, format of original image is used instead.

6.120.3.9 setOutputUrlFromInputUrl()

```
void Digikam::BatchTool::setOutputUrlFromInputUrl ( )
```

if outputSuffix() return null, file extension is the same than original.

6.120.3.10 setSettings()

```
void Digikam::BatchTool::setSettings (
            const BatchToolSettings & settings )
```

See BatchToolSettings container for details.

6.120.3.11 settingsWidget()

```
QWidget * Digikam::BatchTool::settingsWidget ( ) const
```

Return dedicated settings widget registered with registerSettingsWidget().

6.120.3.12 signalAssignSettings2Widget

```
void Digikam::BatchTool::signalAssignSettings2Widget ( )  [signal]
```

See registerSettingsWidget() implementation.

6.120.3.13 slotAssignSettings2Widget

```
virtual void Digikam::BatchTool::slotAssignSettings2Widget ( )  [protected], [pure virtual],
[slot]
```

This method is called by setSettings() through signalAssignSettings2Widget().

6.120.3.14 toolGroup()

```
BatchTool::BatchToolGroup Digikam::BatchTool::toolGroup ( ) const
```

See BatchToolGroup enum for details.

6.120.3.15 toolOperations()

```
virtual bool Digikam::BatchTool::toolOperations ( )  [protected], [pure virtual]
```

This method is called by apply().

6.120.3.16 toolVersion()

```
virtual int Digikam::BatchTool::toolVersion ( ) const  [inline], [virtual]
```

By default, ID is 1. Re-implement this method and increase this ID when tool settings change.

6.126.1 Member Enumeration Documentation

6.126.1.1 QueryStateEnum

```
enum Digikam::BdEngineBackend::QueryStateEnum
```

Enumerator

NoErrors	No errors occurred while executing the query.
SQLError	An SQLError has occurred while executing the query.
ConnectionError	An connection error has occurred while executing the query.

6.126.1.2 Status

```
enum Digikam::BdEngineBackend::Status
```

Enumerator

Unavailable	The database is not available, because it has not been opened yet or because of an error condition.
Open	The database is open. It has not been verified that the schema is up to date. This status is sufficient for use in a context where it can be assumed that the necessary schema check has been carried out by a master process.
OpenSchemaChecked	The database is open, and it has been verified that the schema is up to date, or the schema has been updated.

6.126.2 Constructor & Destructor Documentation

6.126.2.1 BdEngineBackend()

```
Digikam::BdEngineBackend::BdEngineBackend (
            const QString & backendName,
            DbEngineLocking *const locking )  [explicit]
```

The backend name is an arbitrary string that shall be unique for this backend object. It will be used to create unique connection names per backend and thread.

6.126.3 Member Function Documentation

6.126.3.1 asDBDateTime()

```
QDateTime Digikam::BdEngineBackend::asDBDateTime (
            const QDateTime & dateTime ) const
```

SQLite: local date format MySQL: UTC date format

6.126.3.2 checkOrSetWALMode()

```
bool Digikam::BdEngineBackend::checkOrSetWALMode ( )
```

Returns

true the WAL mode is confirmed enabled.

6.126.3.3 close()

```
void Digikam::BdEngineBackend::close ( )
```

Shall only be called from the thread that called open().

6.126.3.4 connectionErrorHandling()

```
bool Digikam::BdEngineBackend::connectionErrorHandling (
            int retries )
```

If it returns true, retry; if it returns false, bail out. Pass the number of connection retries to help with some decisions.

6.126.3.5 execDBAction() [1/2]

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::execDBAction (
            const DbEngineAction & action,
            const QMap< QString, QVariant > & bindingMap,
            QList< QVariant > *const values = nullptr,
            QVariant *const lastInsertId = nullptr )
```

Queries by the specified parameters can have named parameters which are substituted with values from the bindingMap parameter. The result values (if any) are stored within the values list.

6.126.3.6 execDBAction() [2/2]

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::execDBAction (
            const DbEngineAction & action,
            QList< QVariant > *const values = nullptr,
            QVariant *const lastInsertId = nullptr )
```

Queries by the specified parameters mustn't have named parameters. The result values (if any) are stored within the values list.

6.126.3.7 execDBActionQuery()

```
QSqlQuery Digikam::BdEngineBackend::execDBActionQuery (
            const DbEngineAction & action,
            const QMap< QString, QVariant > & bindingMap )
```

Queries by the specified parameters can have named parameters which are substituted with values from the bindingMap parameter. The result values (if any) are stored within the values list. This method returns the last query, which is used to handle special cases.

6.126.3.8 execDirectSql()

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::execDirectSql (
            const QString & query )
```

The query is not prepared, which can be fail in certain situations (e.g. trigger statements on QMYSQL).

6.126.3.9 execDirectSqlWithResult()

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::execDirectSqlWithResult (
            const QString & query,
            QList< QVariant > *const values = nullptr,
            QVariant *const lastInsertId = nullptr )
```

The query is not prepared, which can be fail in certain situations (e.g. trigger statements on QMYSQL).

6.126.3.10 execQuery()

```
QSqlQuery Digikam::BdEngineBackend::execQuery (
            const QString & sql )
```

Methods are provided for up to four bound values (positional binding), or for a list of bound values.

6.126.3.11 execSql() [1/2]

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::execSql (
            const QString & sql,
            const QMap< QString, QVariant > & bindingMap,
            QList< QVariant > *const values = nullptr,
            QVariant *const lastInsertId = nullptr )
```

For special cases it's also possible to add a DbEngineActionType which wraps another data object (also lists or maps) which can be used as field entry or as value (where it's prepared with positional binding). See more on DbEngineActionType class. If the wrapped data object is an instance of list, then the elements are separated by comma. If the wrapped data object is an instance of map, then the elements are inserted in the following way: key1=value1, key2=value2,...,keyN=valueN.

6.126.3.12 execSql() [2/2]

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::execSql (
            const QString & sql,
            QList< QVariant > *const values = nullptr,
            QVariant *const lastInsertId = nullptr )
```

If you are not interested in the returned data, set values to 0. Methods are provided for up to four bound values (positional binding), or for a list of bound values. If you want the last inserted id (and your query is suitable), set lastInsertId to the address of a QVariant. Additionally, methods are provided for prepared statements.

6.126.3.13 execUpsertDBAction()

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::execUpsertDBAction (
            const DbEngineAction & action,
            const QVariant & id,
            const QStringList & fieldNames,
            const QList< QVariant > & values )
```

The corresponding DBAction must contain exactly the named parameters :id, :fieldValueList, :fieldList and :value↩List. You pass the value to be bound to the ":id" field, then two lists of the same size: The first containing the field names, the second one containing the values as QVariants ready for binding.

6.126.3.14 handleQueryResult()

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::handleQueryResult (
            QSqlQuery & query,
            QList< QVariant > *const values,
            QVariant *const lastInsertId )
```

If so BdEngineBackend::ConnectionError is returned. If not, the values are extracted from the query and inserted in the values list, the last insertion id is taken from the query and BdEngineBackend::NoErrors is returned.

6.126.3.15 isInTransaction()

```
bool Digikam::BdEngineBackend::isInTransaction ( ) const
```

Note that a transaction does not require holding CoreDbAccess. Note that this does not give information about other processes locking the database.

6.126.3.16 lastError()

```
QString Digikam::BdEngineBackend::lastError ( )
```

Use CoreDbAccess::lastError for errors presented to the user. This error will be included in that message. It may be empty.

6.126.3.17 lastSQLError()

```
QSqlError Digikam::BdEngineBackend::lastSQLError ( )
```

Use CoreDbAccess::lastError for errors presented to the user. It may be empty.

6.126.3.18 maximumBoundValues()

```
int Digikam::BdEngineBackend::maximumBoundValues ( ) const
```

This value depends on the database engine.

6.126.3.19 open()

```
bool Digikam::BdEngineBackend::open (
            const DbEngineParameters & parameters )
```

Returns

true on success

6.126.3.20 queryErrorHandling()

```
bool Digikam::BdEngineBackend::queryErrorHandling (
            QSqlQuery & query,
            int retries )
```

Handles certain known errors and debug output. If it returns true, reexecute the query; if it returns false, return it as failed. Pass the number of retries already done for this query to help with some decisions.

6.126.3.21 readToList()

```
QList< QVariant > Digikam::BdEngineBackend::readToList (
            QSqlQuery & query )
```

The read process is column wise, which means all data elements of a row is read, then the resultset is switched to the next row.

6.126.3.22 setDbEngineErrorHandler()

```
void Digikam::BdEngineBackend::setDbEngineErrorHandler (
            DbEngineErrorHandler *const handler )
```

This object must be created in the main thread. If a database error occurs, this object can handle problem solving and user interaction.

6.126.3.23 setForeignKeyChecks()

```
void Digikam::BdEngineBackend::setForeignKeyChecks (
            bool check )
```

This function depends on the database engine.

6.187.1 Member Enumeration Documentation

6.187.1.1 Operation

```
enum Digikam::CollectionImageChangeset::Operation
```

Enumerator

Added	"Added" indicates that images have been added to albums.
Removed	"Removed" indicates that an image has been removed from the given album, and has possibly set a status of Removed and a null Album (though this can already have changed to valid values), but the image-specific tables have not been removed.
RemovedAll	"RemovedAll" indicates that for all entries in the specified album, the "Removed" operation has been carried out. This is equivalent to a "Removed" changesets with all image ids in the list, but for RemovedAll, the list may not be explicitly given (may be empty).
Deleted	"Deleted" indicates that the image-specific tables have been removed from the database. While "Removed" means all data is still there, though possibly not accessible from an album, this means all data has been irreversibly deleted.
RemovedDeleted	Special combination: Images which has the "Removed" status have now been "Delete"d. A changeset with Removed or RemovedAll is guaranteed to have been sent anytime before. Image ids nor albums ids may or may be not available in any combination.
Moved	Images have been moved. This is extra information; a Removed and then an Added changeset are guaranteed to be sent subsequently. Album is the source album.
Copied	Images have been copied. This is extra information; an Added changeset is guaranteed to be sent subsequently. Album is the source album.

6.187.2 Constructor & Destructor Documentation

6.187.2.1 CollectionImageChangeset()

```
Digikam::CollectionImageChangeset::CollectionImageChangeset ( )  [default]
```

It is described by a list of affected image ids, a list of affected albums, and an operation. Special Case "Removed↩ All": If all images have been removed from an album, operation is RemovedAll, the album list contains the (now empty) albums, ids() is empty, but containsImage() always returns true. Special Case "RemovedDeleted": Images with the "Removed" status are now irreversibly deleted. ids() and/or albums() may be empty (this means information is not available).

6.187.3 Member Function Documentation

6.187.3.1 ids()

```
QList< qlonglong > Digikam::CollectionImageChangeset::ids ( ) const
```

All special cases where the returned list may be empty are noted above. The lists are valid unless such a case is explicitly mentioned.

6.187.3.2 operator<<()

```
CollectionImageChangeset & Digikam::CollectionImageChangeset::operator<< (
            const CollectionImageChangeset & other )
```

The operations shall not differ between the two sets; the operation is set to Unknown if it differs. This is especially not suitable for RemovedAll changesets.

6.188.1.1 CaseSensitivity

enum Digikam::CollectionLocation::CaseSensitivity

Enumerator

UnknownCaseSensitivity	The location has an unknown case sensitivity.
CaseInsensitive	The location is case insensitive.
CaseSensitive	The location is case sensitive.

6.188.1.2 Status

enum Digikam::CollectionLocation::Status

Enumerator

LocationNull	An invalid status. A location has this status if it is not valid, and it had this status before its creation (for oldStatus information)
LocationAvailable	The location if available. This is the most common status.
LocationHidden	The location is explicitly hidden. This gives no information if the location was available were it not hidden.
LocationUnavailable	The location is currently not available. (Harddisk unplugged, CD not in drive, network fs not mounted etc.) It may become available any time.
LocationDeleted	An invalid status. A location object acquires this status if it has been deleted. The object then does no longer point to an existing location.

6.188.1.3 Type

enum Digikam::CollectionLocation::Type

Enumerator

Undefined	The location is undefined. Keep values constant.
VolumeHardWired	The location is located on a storage device that is built-in without frequent removal: Hard-disk inside the machine.
VolumeRemovable	The location is located on a storage device that can be removed from the local machine, and is expected to be removed. USB stick, USB hard-disk, CD, DVD
Network	The location is available via a network file system. The availability depends on the network connection.

6.189.1 Member Enumeration Documentation

6.189.1.1 LocationCheckResult

```
enum Digikam::CollectionManager::LocationCheckResult
```

Enumerator

LocationInvalidCheck	The check did not succeed, status unknown.
LocationAllRight	All right. The accompanying message may be empty.
LocationHasProblems	Location can be added, but the user should be aware of a problem.
LocationNotAllowed	Adding the location will fail (e.g. there is already a location for the path)

6.189.2 Member Function Documentation

6.189.2.1 addLocation()

```
CollectionLocation Digikam::CollectionManager::addLocation (
            const QUrl & fileUrl,
            const QString & label = QString() )
```

Type and availability will be detected. On failure returns null. This would be the case if the given url is already contained in another collection location. You may pass an optional user-visible label that will be stored in the database. The label has no further meaning and can be freely chosen.

CollectionLocation objects returned are simple data containers. If the corresponding location is returned, the data is still safe to access, but does not represent anything. Therefore, do not store returned objects, but prefer to retrieve them freshly.

6.189.2.2 album()

```
QString Digikam::CollectionManager::album (
            const QUrl & fileUrl )
```

the album root path at the beginning is removed and the second part, starting with "/", ending without a slash, is returned. Example: "/media/fotos/Paris 2007" gives "/Paris 2007" Returns a null QString if the file path is not located in an album root. Returns "/" if the file path is an album root. Note that trailing slashes are removed in the return value, regardless if there was one or not. Note that you have to feed a path/url pointing to a directory. File names cannot be recognized as such by this method, and will be treated as a directory.

6.189.2.3 albumRoot()

```
QUrl Digikam::CollectionManager::albumRoot (
            const QUrl & fileUrl )
```

Example: "/media/fotos/Paris 2007" gives "/media/fotos". Only available (or hidden, but available) album roots are guaranteed to be found.

6.189.2.4 albumRootLabel()

```
QString Digikam::CollectionManager::albumRootLabel (
            int id )
```

Returns a null QString if the root path does not exist or is not available.

6.189.2.5 albumRootPath()

```
QString Digikam::CollectionManager::albumRootPath (
            int id )
```

Returns a null QString if the root path does not exist or is not available.

6.189.2.6 checkHardWiredLocations()

```
QList< CollectionLocation > Digikam::CollectionManager::checkHardWiredLocations ( )
```

If one of these is not available currently, it is added to the list of disappeared locations. This case may happen if a file system is changed, a backup restored or other actions taken that change the UUID, although the data may still be available and mounted. If there are hard-wired volumes available which are candidates for a newly appeared volume (in fact those that do not contain any collections currently), they are added to the map, identifier -> i18n'ed user presentable description. The identifier can be used for changeVolume.

6.189.2.7 checkLocation()

```
CollectionManager::LocationCheckResult Digikam::CollectionManager::checkLocation (
            const QUrl & fileUrl,
            QList< CollectionLocation > & assumeDeleted,
            QString * message = nullptr,
            QString * suggestedMessageIconName = nullptr )
```

Creates an info message describing the result of identification or possible problems. The text is i18n'ed and can be presented to the user. The returned result enum describes the test result.

6.189.2.8 isAlbumRoot() [1/2]

```
bool Digikam::CollectionManager::isAlbumRoot (
            const QString & filePath )
```

Using CoreDbUrl's method is fine.

6.189.2.9 isAlbumRoot() [2/2]

```
bool Digikam::CollectionManager::isAlbumRoot (
            const QUrl & fileUrl )
```

It will return false if the path is a path below an album root, or if the path does not belong to an album root. Example: "/media/fotos/Paris 2007" is an album with album root "/media/fotos". "/media/fotos" returns true, "/media/fotos/Paris 2007" and "/media" return false. Only available (or hidden, but available) album roots are guaranteed to be found.

6.189.2.10 locationForAlbumRoot()

```
CollectionLocation Digikam::CollectionManager::locationForAlbumRoot (
            const QUrl & fileUrl )
```

The path must be an album root with isAlbumRoot() == true. Returns 0 if no collection location matches. Only available (or hidden, but available) locations are guaranteed to be found.

6.189.2.11 locationForUrl()

```
CollectionLocation Digikam::CollectionManager::locationForUrl (
            const QUrl & fileUrl )
```

Equivalent to calling locationForAlbumRoot(albumRoot(fileUrl)). Only available (or hidden, but available) locations are guaranteed to be found.

6.189.2.12 locationStatusChanged

```
void Digikam::CollectionManager::locationStatusChanged (
            const CollectionLocation & location,
            int oldStatus )  [signal]
```

This means that the location became available, hidden or unavailable.

An added location will change its status after addition, from Null to Available, Hidden or Unavailable.

A removed location will change its status to Deleted during the removal; in this case, you shall not use the object passed with this signal with any method of CollectionManager.

The second signal argument is of type CollectionLocation::Status and describes the status before the state change occurred

6.189.2.13 migrateToVolume()

```
void Digikam::CollectionManager::migrateToVolume (
            const CollectionLocation & location,
            const QString & identifier )
```

Use this *only* to react to changes like those detailed for checkHardWiredLocations; the actual data pointed to shall be unchanged.

6.189.2.14 oneAlbumRoot()

```
QUrl Digikam::CollectionManager::oneAlbumRoot ( )
```

to suggest as default place when the user wants to add files.

6.189.2.15 refresh()

```
void Digikam::CollectionManager::refresh ( )
```

Enables the watch.

6.189.2.16 removeLocation()

```
void Digikam::CollectionManager::removeLocation (
            const CollectionLocation & location )
```

This means that all images contained on the location will be removed from the database, all tags will be lost.

6.189.2.17 setWatchDisabled()

```
void Digikam::CollectionManager::setWatchDisabled ( )
```

It will be re-enabled as soon as refresh() is called or any other action triggered.

6.191.1 Member Enumeration Documentation

6.191.1.1 FileScanMode

enum Digikam::CollectionScanner::FileScanMode

Enumerator

NormalScan	The file will be scanned like it is done for any usual scan. If it was not modified, no further action is taken. If the file is not known yet, it will be fully scanned, or, if an identical file is found, this data will be copied.
ModifiedScan	The file will scanned like a modified file. Only a selected portion of the metadata will be updated into the database. If the file is not known yet, it will be fully scanned, or, if an identical file is found, this data will be copied.
Rescan	The file will be scanned like a completely new file. The complete metadata is re-read into the database. No search for identical files will be done.
CleanScan	This is the same as Rescan but the database metadata will be cleaned up if the corresponding metadata write option is enabled.

6.191.2 Member Function Documentation

6.191.2.1 completeScan()

```
void Digikam::CollectionScanner::completeScan ( )
```

Only a full scan can finally remove deleted files from the database, only a full scan will mark the database as scanned. The database will be locked while running (Note: this is not done for partialScans).

6.191.2.2 createHintContainer()

```
CollectionScannerHintContainer * Digikam::CollectionScanner::createHintContainer ( )  [static]
```

They allow to carry out optimizations. Record hints in a container, and provide the container to the collection scanner. The Container set in setHintContainer must be one created by createContainer.

6.191.2.3 databaseInitialScanDone()

```
bool Digikam::CollectionScanner::databaseInitialScanDone ( )  [static]
```

This is the first complete scan after creation of a new database file (or update requiring a rescan)

6.191.2.4 finishCompleteScan()

```
void Digikam::CollectionScanner::finishCompleteScan (
            const QStringList & albumPaths )
```

The relevant albums are available from deferredAlbumPaths() when completeScan() has finished. You need to call finishCompleteScan() afterwards with the list to get the same complete scan than undeferred completeScan().

6.191.2.5 finishedScanningAlbumRoot

```
void Digikam::CollectionScanner::finishedScanningAlbumRoot (
            const QString & albumRoot )  [signal]
```

Note that start/finishScanningAlbum may be emitted recursively.

6.191.2.6 partialScan()

```
void Digikam::CollectionScanner::partialScan (
            const QString & filePath )
```

The includes scanning for new files + albums and updating modified file data. Files no longer found in the specified path however are not completely removed, but only marked as removed. They will be removed only after a complete scan.

6.191.2.7 scanFile() [1/2]

```
qlonglong Digikam::CollectionScanner::scanFile (
            const QString & albumRoot,
            const QString & album,
            const QString & fileName,
            FileScanMode mode = ModifiedScan )
```

If you already have this info it need not be retrieved. Returns the image id of the file, or -1 on failure.

6.191.2.8 scanFile() [2/2]

```
qlonglong Digikam::CollectionScanner::scanFile (
            const QString & filePath,
            FileScanMode mode = ModifiedScan )
```

Returns the image id of the file.

6.191.2.9 scannedFiles

```
void Digikam::CollectionScanner::scannedFiles (
            int filesScanned )  [signal]
```

In between these two signals, the sum of filesScanned of all sent signals equals the one reported by finished↩ ScanningAlbum()

6.191.2.10 setNeedFileCount()

```
void Digikam::CollectionScanner::setNeedFileCount (
            bool on )
```

Default is off. If on, setSignalEnabled() must be on to take effect.

6.191.2.11 setPerformFastScan()

```
void Digikam::CollectionScanner::setPerformFastScan (
            bool on )
```

Default is on.

6.191.2.12 setSignalsEnabled()

```
void Digikam::CollectionScanner::setSignalsEnabled (
            bool on )
```

Default is off.

6.191.2.13 totalFilesToScan

```
void Digikam::CollectionScanner::totalFilesToScan (
            int count )  [signal]
```

Gives the number of the files that need to be scanned.

6.209.1 Detailed Description

The ContextMenuHelper class helps adding commonly used actions and menus. Use this class to add

- actions from the actionCollection
- standard actions (copy, paste, delete)
- temporary actions
- predefined special actions
- predefined submenus to the menu.

All addAction() methods take a special parameter 'addDisabled'. This parameter controls if disabled actions are added to the menu. Normally adding disabled actions is turned off, to clean up the menu and make it more readable.

If the ContextMenuHelper class is used, you need to call its own exec() method, instead the one from the parent menu. This way signals from special menus can be emitted and connected to the appropriate slots.

6.209.2 Constructor & Destructor Documentation

6.209.2.1 ContextMenuHelper()

```
Digikam::ContextMenuHelper::ContextMenuHelper (
            QMenu *const parent )  [explicit]
```

Parameters

parent	the menu the helper class is linked to

6.209.3 Member Function Documentation

6.209.3.1 addAction() [1/3]

```
void Digikam::ContextMenuHelper::addAction (
            const QString & name,
            bool addDisabled = false )
```

This method adds actions from the actionCollection. The actionCollection can be set in the constructor of the ContextMenuHelper class.

Parameters

name	the name of the action in the actionCollection
addDisabled	if set, disabled actions are added to the menu

6.209.3.2 addAction() [2/3]

```
void Digikam::ContextMenuHelper::addAction (
            QAction *const action,
            bool addDisabled = false )
```

Sometimes it is necessary to define actions that only exist in the current context menu content. Use this method to add such an action.

Parameters

action	the action to add
addDisabled	if set, disabled actions are added to the menu

6.209.3.3 addAction() [3/3]

```
void Digikam::ContextMenuHelper::addAction (
            QAction *const action,
            QObject *const recv,
            const char *const slot,
            bool addDisabled = false )
```

Use this method if you want to add a temporary action and immediately connect it to the receiving slot.

Parameters

action	the action to add
recv	the receiver of the triggered action
slot	the slot to connect the triggered action to
addDisabled	if set, disabled actions are added to the menu

6.209.3.4 addActionNewAlbum()

```
void Digikam::ContextMenuHelper::addActionNewAlbum (
            AlbumModificationHelper *const helper,
            PAlbum *const parentAlbum = nullptr )
```

The tag modification helper is used to execute the action. You must set the parent tag to use on modification helper.

6.209.3.5 addActionNewTag()

```
void Digikam::ContextMenuHelper::addActionNewTag (
            TagModificationHelper *const helper,
            TAlbum *const parentTag = nullptr )
```

The tag modification helper is used to execute the action. You must set the parent tag to use on modification helper.

6.209.3.6 addAlbumCheckUncheckActions()

```
void Digikam::ContextMenuHelper::addAlbumCheckUncheckActions (
            Album *const album )
```

Note: Call setAlbumModel before, or this will have no effect.

6.209.3.7 addAssignTagsMenu()

```
void Digikam::ContextMenuHelper::addAssignTagsMenu (
            const imageIds & ids )
```

This menu will provide a list of all tags available so that they can be assigned to the current selected items.

To make this menu work, you need to run exec() from this class, otherwise the signals are not emitted and you will not be able to react on triggered actions from this menu. Make sure to connect the signals to the appropriate slots in the context menu handling method.

Parameters

ids	the selected items

See also

exec()

signalAssignTag()

6.209.3.8 addGotoMenu()

```
void Digikam::ContextMenuHelper::addGotoMenu (
            const imageIds & ids )
```

This menu will provide the following actions for the given item:

- Goto Album
- Goto Date
- Goto Tag To make this menu work, you need to run exec() from this class, otherwise the signals are not emitted and you will not be able to react on triggered actions from this menu. Make sure to connect the signals to the appropriate slots in the context menu handling method.

Parameters

ids	the list of selected items

See also

exec()

signalGotoAlbum() signalGotoDate() signalGotoTag()

TODO:tags to be ported to multiple selection

6.209.3.9 addGroupMenu()

```
void Digikam::ContextMenuHelper::addGroupMenu (
             const imageIds & ids,
             const QList< QAction * > & extraMenuItems = QList<QAction*>() )
```

This menu will provide actions open, close, add to, remove from, or split a group.

addGroupActions will add the actions as a flat list, not in a submenu. Note: Call setItemFilterModel before to have Open/Close group actions.

6.209.3.10 addIQSAction()

```
void Digikam::ContextMenuHelper::addIQSAction (
             QObject *const recv,
             const char *const slot )
```

Parameters

recv	the receiver of the triggered action
slot	the slot to connect the triggered action to

6.209.3.11 addLabelsAction()

```
void Digikam::ContextMenuHelper::addLabelsAction ( )
```

This action will provide methods to assign pick/color/rating labels to the currently selected items.

To make this menu work, you need to run exec() from this class, otherwise the signals are not emitted and you will not be able to react on triggered actions from this menu. Make sure to connect the signals to the appropriate slots in the context menu handling method.

signalAssignColorLabel()

signalAssignRating()

6.209.3.12 addOpenAndNavigateActions()

```
void Digikam::ContextMenuHelper::addOpenAndNavigateActions (
            const imageIds & ids,
            bool lightTable = false )
```

This is a convenience function to ensure consistent menus and reduce code duplication.

Parameters

ids	the list of selected items
lightTable	for the light table

6.209.3.13 addRemoveAllTags()

```
void Digikam::ContextMenuHelper::addRemoveAllTags (
            const imageIds & ids )
```

Removes all tags from the selected item ids except face tags.

Parameters

ids	the selected items

6.209.3.14 addRemoveTagsMenu()

```
void Digikam::ContextMenuHelper::addRemoveTagsMenu (
            const imageIds & ids )
```

This menu will provide a list of all tags assigned to the current items. Actions triggered in here will remove the selected tag from the items.

To make this menu work, you need to run exec() from this class, otherwise the signals are not emitted and you will not be able to react on triggered actions from this menu. Make sure to connect the signals to the appropriate slots in the context menu handling method.

Parameters

ids	the selected items

See also

exec()

signalRemoveTag()

6.209.3.15 addServicesMenu()

```
void Digikam::ContextMenuHelper::addServicesMenu (
            const QList< QUrl > & selectedItems )
```

The services menu is used to open the selected items in a different application. It will query the item for registered services and provide them in a submenu. The menu will be titled "Open With...".

Parameters

selectedItems	the list of selected items

6.209.3.16 addStandardActionCopy()

6.209.3.18 addStandardActionItemDelete()

```
void Digikam::ContextMenuHelper::addStandardActionItemDelete (
            QObject *const recv,
            const char *const slot,
            int quantity = 1 )
```

Parameters

recv	the receiver of the triggered action
slot	the slot to connect the triggered action to
quantity	the number of the files that should be deleted. This parameter is used for the action name and is normally used when deleting more then one item.

6.209.3.19 addStandardActionLightTable()

```
void Digikam::ContextMenuHelper::addStandardActionLightTable ( )
```

Do not use addAction() to add the lighttable action, because we need to handle special cases here. Depending on whether the lighttable window has already been created and filled with items, we set different actions.

6.209.3.20 addStandardActionPaste()

```
void Digikam::ContextMenuHelper::addStandardActionPaste (
            QObject *const recv,
            const char *const slot )

```
void Digikam::ContextMenuHelper::addStandardActionThumbnail (
            const imageIds & ids,
            Album *const album )
```

Do not use addAction() to add the thumbnail action, because we need to handle special cases here. Depending on whether the current view is album or icon view, we set different actions.

Parameters

ids	the selected items in the current view
album	the current album the AlbumIconView is displaying

6.209.3.22 addSubMenu()

```
void Digikam::ContextMenuHelper::addSubMenu (
            QMenu * subMenu )
```

Parameters

subMenu	the submenu to be added

```
QAction * Digikam::ContextMenuHelper::exec (
            const QPoint & pos,
            QAction *const at = nullptr )
```

Always use this method instead the one from the parent menu. It will ensure that the signals are emitted and special cases are handled.

Parameters

pos	position of the triggered action in the registered menu
at	the action that should be at the position pos

Returns

the triggered action

6.209.3.24 setAlbumModel()

```
void Digikam::ContextMenuHelper::setAlbumModel (
            AbstractCheckableAlbumModel *const model )
```

The check/uncheck actions will operate directly on the model.

6.209.3.25 setItemFilterModel()

```
void Digikam::ContextMenuHelper::setItemFilterModel (
            ItemFilterModel *const model )
```

Some of the group actions will operate directly on the model.

6.214.1 Detailed Description

While you hold an instance of CoreDbAccess, the database access is locked for other threads, but *not* for other processes. This is due to the fact that while databases allow concurrent access (of course), their client libs may not be thread-safe.

When initializing your application, you need to call two methods:

- in a not-yet-multithreaded context, you need to call setParameters
- to make sure that the database is available and the schema is properly initialized, call checkReadyForUse()

6.214.2 Constructor & Destructor Documentation

6.214.2.1 CoreDbAccess()

```
Digikam::CoreDbAccess::CoreDbAccess ( )
```

Note that when initializing your app, setParameters need to be called (in a not-yet-multithreaded context) for this to work. If the database is not yet opened, it will be opened. The schema will not be checked, use checkReadyForUse() for a full opening process including schema update and error messages.

6.214.3 Member Function Documentation

6.214.3.1 checkReadyForUse()

```
bool Digikam::CoreDbAccess::checkReadyForUse (
            InitializationObserver *const observer = nullptr )  [static]
```

If the parameters were not changed, this method has no effect.

Returns

if the database is ready for use

6.214.3.2 cleanUpDatabase()

```
void Digikam::CoreDbAccess::cleanUpDatabase ( )  [static]
```

When this function has been called, the access can be restored by calling setParameters. Construction a database access object otherwise after calling this method will crash.

6.214.3.3 setLastError()

```
void Digikam::CoreDbAccess::setLastError (
            const QString & error )
```

This method is not for public use.

6.214.3.4 setParameters()

```
void Digikam::CoreDbAccess::setParameters (
            const DbEngineParameters & parameters )  [static]
```

Call this function at least once in the starting phase of your application, when no other threads will yet access the database, to initialize DatabaseAcccess. After this initial call, it is thread-safe to call this function again. In a subsequent call, if the parameters are identical, nothing is done. If the parameters change, the current database will be closed. When parameters have been set or changed, the new one will be opened on-demand, i.e. when the first CoreDbAccess object is constructed.

6.215 Digikam::CoreDbAccessUnlock Class Reference

Public Member Functions

- CoreDbAccessUnlock ()

  Acquire an object of this class if you want to assure that the CoreDbAccess is not held during the lifetime of the object.
- **CoreDbAccessUnlock** (CoreDbAccess ∗const access)

6.215.1 Constructor & Destructor Documentation

6.215.1.1 CoreDbAccessUnlock()

```
Digikam::CoreDbAccessUnlock::CoreDbAccessUnlock ( )
```

At creation, the lock is obtained shortly, then all locks are released. At destruction, all locks are acquired again. If you need to access any locked structures during lifetime, acquire a new CoreDbAccess.

6.224.1 Member Function Documentation

6.224.1.1 album()

```
QString Digikam::CoreDbUrl::album ( ) const
```

In the example above, the album is "/Summer 2007"

6.224.1.2 albumRoot()

```
QUrl Digikam::CoreDbUrl::albumRoot ( ) const
```

If the URL has another protocol, the return value of these methods is undefined. Album URL Returns the album root URL of the file or album referenced by this URL In the example above, this is "file://media/fotos"

6.224.1.3 areaCoordinates()

```
bool Digikam::CoreDbUrl::areaCoordinates (
            double * lat1,
            double * lat2,
            double * lon1,
            double * lon2 ) const
```

Returns the coordinates surrounding the map area. Returns true if the string to number conversion was ok.

6.224.1.4 fromAlbumAndName()

```
CoreDbUrl Digikam::CoreDbUrl::fromAlbumAndName (
            const QString & name,
            const QString & album,
            const QUrl & albumRoot,
            int albumRootId,
            const DbEngineParameters & parameters = CoreDbAccess::parameters() )  [static]
```

If name is empty, the album is referenced. Other parameters as above.

6.224.1.5 fromDateForMonth()

```
CoreDbUrl Digikam::CoreDbUrl::fromDateForMonth (
            const QDate & date,
            const DbEngineParameters & parameters = CoreDbAccess::parameters() )  [static]
```

(The whole month of the given date will included in the referenced time span)

6.224.1.6 fromDateForYear()

```
CoreDbUrl Digikam::CoreDbUrl::fromDateForYear (
            const QDate & date,
            const DbEngineParameters & parameters = CoreDbAccess::parameters() )  [static]
```

(The whole year of the given date will included in the referenced time span)

6.224.1.7 fromDateRange()

```
CoreDbUrl Digikam::CoreDbUrl::fromDateRange (
            const QDate & startDate,
            const QDate & endDate,
            const DbEngineParameters & parameters = CoreDbAccess::parameters() )  [static]
```

To cover the whole year of 1984, you would pass 1/1/1984 and 1/1/1985.

6.224.1.8 fromFileUrl()

```
CoreDbUrl Digikam::CoreDbUrl::fromFileUrl (
            const QUrl & fileUrl,
            const QUrl & albumRoot,
            int albumRootId,
            const DbEngineParameters & parameters = CoreDbAccess::parameters() )  [static]
```

It provides functions to set and get the parameters stored in such a URL. (with the exception of the search parameters in a search URL, which are out of the scope of this class.) Create a digikamalbums:/ URL from a `file://` URL. The file URL can point to a file or a directory (an album in this case). The additional information stored in the URL need to be supplied as well:

- The album root in which the entity pointed to is stored. This is the left part of the file URL. (if the file is "/media/fotos/Summer 2007/001.jpg", the album root may be "/media/fotos")
- The parameters of the database that is referenced

6.224.1.9 fromTagIds()

```
CoreDbUrl Digikam::CoreDbUrl::fromTagIds (
            const QList< int > & tagIds,
            const DbEngineParameters & parameters = CoreDbAccess::parameters() )  [static]
```

An empty list references the root tag.

6.224.1.10 isAlbumUrl()

```
bool Digikam::CoreDbUrl::isAlbumUrl ( ) const
```

The protocol string is of course available via protocol().

6.224.1.11 name()

```
QString Digikam::CoreDbUrl::name ( ) const
```

In the example above, this is "001.jpg"

6.224.1.12 parameters()

```
DbEngineParameters Digikam::CoreDbUrl::parameters ( ) const
```

Applicable to all protocols.

6.224.1.13 searchId()

```
int Digikam::CoreDbUrl::searchId ( ) const
```

Return the id of the search.

6.224.1.14 startDate()

```
QDate Digikam::CoreDbUrl::startDate ( ) const
```

Return the referenced start date (included in the referenced span)

6.224.1.15 tagId()

```
int Digikam::CoreDbUrl::tagId ( ) const
```

Returns the tag ID, or -1 if the root tag is referenced

6.228.1 Constructor & Destructor Documentation

6.228.1.1 CurvesContainer()

```
Digikam::CurvesContainer::CurvesContainer ( )  [default]
```

Initially, the values are empty. Call initialize() before adjusting values manually.

6.228.2 Member Function Documentation

6.228.2.1 isEmpty()

```
bool Digikam::CurvesContainer::isEmpty ( ) const
```

A non-empty container can also be linear; test for isLinear() of the resulting ImageCurves. Note: If an ImageCurves is linear, it will return an empty container.

6.228.2.2 isStoredLosslessly()

```
bool Digikam::CurvesContainer::isStoredLosslessly ( ) const
```

isStoredLosslessly returns false if the curve cannot be losslessly stored in XML because it would be too large (free 16 bit). It is then lossily compressed.

6.228.3 Member Data Documentation

6.228.3.1 curvesType

```
int Digikam::CurvesContainer::curvesType = ImageCurves::CURVE_SMOOTH
```

Free : QPolygon have size of 255 or 65535 values.

6.246.1 Detailed Description

template<class T>
class Digikam::DatabaseFields::Hash< T >

You can use the class like a normal QHash with the value type defined by you, and as keys the members of the DatabaseFields enums. You can only use single enum members as keys, not or'ed numbers. You can use one custom enum, cast to DatabaseFields::CustomEnum, which can have at most 26 flag values (1 << 0 to 1 << 26). Pass this as the optional second template parameter.

6.246.2 Member Function Documentation

6.246.2.1 uniqueKey()

```
template<class T >
static unsigned int Digikam::DatabaseFields::Hash< T >::uniqueKey (
            Images f )  [inline], [static]
```

Note

We use the upper 6 bits to distinguish the enums, and give the lower 26 bits to the flags. So we can store up to 64 enums, with 26 flags each.

```
Set & Digikam::DatabaseFields::Set::setFields (

overloading operator|= creates ambiguity with the database fields' operator|=, therefore we give it another name.

6.283.1 Detailed Description

The values can be read from and written to a QUrl.

6.283.2 Member Function Documentation

6.283.2.1 defaultParameters()

```
DbEngineParameters Digikam::DbEngineParameters::defaultParameters (
            const QString & databaseType )  [static]
```

For Mysql, it return internal server configuration.

6.283.2.2 getCoreDatabaseNameOrDir()

```
QString Digikam::DbEngineParameters::getCoreDatabaseNameOrDir ( ) const
```

Note

In case of SQLite, the database name typically is a file. For non-SQLite, this simply handle the database name.

6.283.2.3 readFromConfig()

```
void Digikam::DbEngineParameters::readFromConfig (
            const QString & configGroup = QString() )
```

You can specify the group, or use the default value.

6.283.2.4 SQLiteDatabaseType()

```
QString Digikam::DbEngineParameters::SQLiteDatabaseType ( )  [static]
```

If you have a DbEngineParameters object already, you can use isSQLite() as well. These strings are identical to the driver identifiers in the Qt SQL module.

- void setCategorizedModel (bool categorizedModel)

- void sort (int column, Qt::SortOrder order=Qt::AscendingOrder) override

  Overridden from QSortFilterProxyModel.
- bool sortCategoriesByNaturalComparison () const
- int sortColumn () const
- Qt::SortOrder sortOrder () const

Protected Member Functions

- virtual int compareCategories (const QModelIndex &left, const QModelIndex &right) const

  This method compares the category of the `left` index with the category of the `right` index.
- bool lessThan (const QModelIndex &left, const QModelIndex &right) const override

  Overridden from QSortFilterProxyModel.
- virtual bool subSortLessThan (const QModelIndex &left, const QModelIndex &right) const

  This method has a similar purpose as lessThan() has on QSortFilterProxyModel.

6.303.1 Detailed Description

It is meant to be used along with DCategorizedView class.

In general terms all you need to do is to reimplement subSortLessThan() and compareCategories() methods. In order to make categorization work, you need to also call setCategorizedModel() class to enable it, since the categorization is disabled by default.

6.303.2 Member Enumeration Documentation

6.303.2.1 AdditionalRoles

`enum Digikam::DCategorizedSortFilterProxyModel::AdditionalRoles`

Enumerator

CategoryDisplayRole	This role is used for asking the category to a given index. **Note** use printf "0x%08X\n" $(($RANDOM∗$RANDOM)) to define additional roles.
CategorySortRole	This role is used for sorting categories. You can return a string or a long long value. Strings will be sorted alphabetically while long long will be sorted by their value. Please note that this value won't be shown on the view, is only for sorting purposes. What will be shown as "Category" on the view will be asked with the role CategoryDisplayRole.

6.303.3 Member Function Documentation

6.303.3.1 compareCategories()

```
int Digikam::DCategorizedSortFilterProxyModel::compareCategories (
            const QModelIndex & left,
            const QModelIndex & right ) const  [protected], [virtual]
```

Internally and if not reimplemented, this method will ask for `left` and `right` models for role CategorySortRole. In order to correctly sort categories, the data() method of the model should return a qlonglong (or numeric) value, or a QString object. QString objects will be sorted with QString::localeAwareCompare if sortCategoriesByNaturalComparison() is true.

Note

Please have present that: QString(QChar(QChar::ObjectReplacementCharacter)) > QString(QChar(QChar::ReplacementCharacter)) > [all possible strings] > QString();

This means that QString() will be sorted the first one, while QString(QChar(QChar::ObjectReplacementCharacter)) and QString(QChar(QChar::ReplacementCharacter)) will be sorted in last position.

Warning

Please note that data() method of the model should return always information of the same type. If you return a QString for an index, you should return always QStrings for all indexes for role CategorySortRole in order to correctly sort categories. You cannot mix by returning a QString for one index, and a qlonglong for other.

Note

If you need a more complex layout, you will have to reimplement this method.

Returns

A negative value if the category of `left` should be placed before the category of `right`. 0 if `left` and `right` are on the same category, and a positive value if the category of `left` should be placed after the category of `right`.

Reimplemented in Digikam::ItemFilterModel, ShowFoto::ShowfotoFilterModel, and Digikam::ImportFilterModel.

6.303.3.2 isCategorizedModel()

```
bool Digikam::DCategorizedSortFilterProxyModel::isCategorizedModel ( ) const
```

Returns

whether the model is categorized or not. Disabled by default.

6.303.3.3 lessThan()

```
bool Digikam::DCategorizedSortFilterProxyModel::lessThan (
            const QModelIndex & left,
            const QModelIndex & right ) const  [override], [protected]
```

If you are subclassing DCategorizedSortFilterProxyModel, you will probably not need to reimplement this method.

It calls compareCategories() to sort by category. If the both items are in the same category (i.e. compareCategories returns 0), then subSortLessThan is called.

Returns

Returns true if the item `left` is less than the item `right` when sorting.

Warning

You usually won't need to reimplement this method when subclassing from DCategorizedSortFilterProxyModel.

6.303.3.4 setCategorizedModel()

```
void Digikam::DCategorizedSortFilterProxyModel::setCategorizedModel (
            bool categorizedModel )
```

Parameters

categorizedModel	whether to enable or disable the categorization feature.

6.303.3.5 setSortCategoriesByNaturalComparison()

```
void Digikam::DCategorizedSortFilterProxyModel::setSortCategoriesByNaturalComparison (

Usually this will be triggered when you have received an event, and its position matched some "hot spot".

You give this action the integer you want, and having connected this signal to your code, the connected slot can perform the needed changes (view, model, selection model, delegate...)

6.307.1 Constructor & Destructor Documentation

6.307.1.1 DColor()

```
Digikam::DColor::DColor (
            uchar * data,
            bool sixteenBit = false )  [inline], [explicit]
```

Equivalent to setColor()

6.307.2 Member Function Documentation

6.307.2.1 blendZero()

```
void Digikam::DColor::blendZero ( )  [inline]
```

These functions are used by DColorComposer. Look at that code to learn how to use them for composition if you want to use them in optimized code.

6.307.2.2 getHSL()

```
void Digikam::DColor::getHSL (
            int *const h,
            int *const s,
            int *const l ) const
```

Alpha is ignored for the conversion.

6.307.2.3 getYCbCr()

```
void Digikam::DColor::getYCbCr (
            double *const y,
            double *const cb,
            double *const cr ) const
```

Alpha is ignored for the conversion.

6.307.2.4 premultiply()

```
void Digikam::DColor::premultiply ( )  [inline]
```

DImg stores the color non-premultiplied. Inline methods.

6.307.2.5 setColor()

```
void Digikam::DColor::setColor (
            uchar *const data,
            bool sixteenBit = false )  [inline]
```

These methods are used in quite a few image effects, typically in loops iterating the data.

If sixteenBit is false, 4 bytes are read. If sixteenBit is true, 8 bytes are read. Inline method.

Providing them as inline methods allows the compiler to optimize better.

6.307.2.6 setHSL()

```
void Digikam::DColor::setHSL (
            int h,
            int s,
            int l,
            bool sixteenBit )
```

Alpha is set to be fully opaque. sixteenBit determines both how the HSL values are interpreted and the sixteenBit value of this color after this operation.

6.307.2.7 setPixel()

```
void Digikam::DColor::setPixel (
            uchar *const data ) const  [inline]
```

If sixteenBit is false, 4 bytes are written. If sixteenBit is true, 8 bytes are written. Inline method.

6.307.2.8 setYCbCr()

```
void Digikam::DColor::setYCbCr (
            double y,
            double cb,
            double cr,
            bool sixteenBit )
```

Alpha is set to be fully opaque. sixteenBit determines both how the YCrCb values are interpreted and the sixteenBit value of this color after this operation.

6.308.1 Member Enumeration Documentation

6.308.1.1 CompositingOperation

```
enum Digikam::DColorComposer::CompositingOperation
```

For the Porter-Duff rules, the formula is component = (source * fs + destination * fd) where fs, fd according to the following table with sa = source alpha, da = destination alpha:

None fs: sa fd: 1.0-sa Clear fs: 0.0 fd: 0.0 Src fs: 1.0 fd: 0.0 Src Over fs: 1.0 fd: 1.0-sa Dst Over fs: 1.0-da fd: 1.0 Src In fs: da fd: 0.0 Dst In fs: 0.0 fd: sa Src Out fs: 1.0-da fd: 0.0 Dst Out fs: 0.0 fd: 1.0-sa

Src Atop fs: da fd: 1.0-sa Dst Atop fs: 1.0-da fd: sa Xor fs: 1.0-da fd: 1.0-sa

None is the default, classical blending mode, a "Src over" simplification: Blend non-premultiplied RGBA data "src over" a fully opaque background. Src is the painter's algorithm. All other operations require premultiplied colors. The documentation of java.awt.AlphaComposite (Java 1.5) provides a good introduction and documentation on Porter Duff.

6.308.2 Member Function Documentation

6.308.2.1 compose() [1/2]

```
virtual void Digikam::DColorComposer::compose (
            DColor & dest,
            DColor & src )  [pure virtual]
```

Src and Dest are composed and the result is written to dest. No pre-/demultiplication is done by this method, use the other overloaded methods, which call this method, if you need pre- or demultiplication (you need it if any of the colors are read from or written to a DImg).

If you just pass the object to a DImg method, you do not need to call this. Call this function if you want to compose two colors. Implement this function if you create a custom DColorComposer.

The bit depth of source and destination color must be identical.

6.308.2.2 compose() [2/2]

```
void Digikam::DColorComposer::compose (
            DColor & dest,
            DColor & src,
            DColorComposer::MultiplicationFlags multiplicationFlags )  [virtual]
```

Pre- and demultiplication operations are done as specified. For PorterDuff operations except PorterDuffNone, you need

- PremultiplySrc if src is not premultiplied (read from a DImg)
- PremultiplyDst if dst is not premultiplied (read from a DImg)
- DemultiplyDst if dst will be written to non-premultiplied data (a DImg)

6.308.2.3 getComposer()

```
DColorComposer * Digikam::DColorComposer::getComposer (
            DColorComposer::CompositingOperation rule )  [static]
```

The object needs to be deleted by the caller.

DConfigDlgView).

6.312.2 Member Enumeration Documentation

6.312.2.1 FaceType

`enum Digikam::DConfigDlg::FaceType`

- `Auto` - A dialog with a face based on the structure of the available pages. If only a single page is added, the dialog behaves like in `Plain` mode, with multiple pages without sub pages it behaves like in `List` mode and like in `Tree` mode otherwise.
- `Plain` - A normal dialog.
- `List` - A dialog with an icon list on the left side and a representation of the contents on the right side.
- `Tree` - A dialog with a tree on the left side and a representation of the contents on the right side.
- `Tabbed` - A dialog with a tab bar above the representation of the contents.

- void widgetModified ()

  If retrieveSettings() was told to track changes then if any known setting was changed this signal will be emitted.
- void widgetSettingsChanged (QWidget ∗widget)

  One or more of the settings have been changed.

Static Protected Member Functions

- static void **initMaps** ()

  Initializes the property maps.

6.313.1 Detailed Description

It also can emit signals when settings have been changed (settings were saved) or modified (the user changes a checkbox from on to off).

The object names of the widgets to be managed have to correspond to the names of the configuration entries in the KConfigSkeleton object plus an additional "kcfg_" prefix. For example a widget with the object name "kcfg_↩ MyOption" would be associated to the configuration entry "MyOption".

The widget classes of Qt are supported out of the box.

Custom widget classes are supported if they have a Q_PROPERTY defined for the property representing the value edited by the widget. By default the property is used for which "USER true" is set. For using another property, see below.

```
bool Digikam::DConfigDlgMngr::parseChildren (
            const QWidget * widget,

6.321.1 Detailed Description

The combo box contains the date in text form, and clicking the combo box arrow will display a 'popup' style date picker.

This widget also supports advanced features like allowing the user to type in the day name to get the date. The following keywords are supported (in the native language): tomorrow, yesterday, today, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday.

6.321.2 Member Function Documentation

6.321.2.1 assignDate()

```
bool Digikam::DDateEdit::assignDate (
            const QDate & date )  [protected], [virtual]
```

This method is used internally to set the widget's date value. As a virtual method, it allows derived classes to perform additional validation on the date value before it is set. Derived classes should return true if QDate::isValid(`date`) returns false.

Parameters

date	The new date to set.

Returns

True if the date was set, false if it was considered invalid and remains unchanged.

6.321.2.2 date()

```
QDate Digikam::DDateEdit::date ( ) const
```

Returns

The date entered. This date could be invalid, you have to check validity yourself.

6.321.2.3 dateChanged

6.322.1 Constructor & Destructor Documentation

6.322.1.1 DDatePicker() [1/2]

```
Digikam::DDatePicker::DDatePicker (
            QWidget *const parent = nullptr )  [explicit]
```

The current date will be displayed initially.

6.322.1.2 DDatePicker() [2/2]

```
Digikam::DDatePicker::DDatePicker (
            const QDate & dt,
            QWidget *const parent = nullptr )  [explicit]
```

The given date will be displayed initially.

6.322.2 Member Function Documentation

6.322.2.1 date()

```
const QDate & Digikam::DDatePicker::date ( ) const
```

Returns

The selected date.

6.322.2.2 dateChanged

```
void Digikam::DDatePicker::dateChanged (
            const QDate & date )  [signal]
```

Usually, this does not mean that the date has been entered, since the date also changes, for example, when another month is selected.

See also

dateSelected

6.322.2.3 dateEntered

```
void Digikam::DDatePicker::dateEntered (
            const QDate & date )  [signal]
```

Connect to both dateEntered() and dateSelected() to receive all events where the user really enters a date.

6.322.2.4 dateSelected

```
void Digikam::DDatePicker::dateSelected (
            const QDate & date )  [signal]
```

It has the same meaning as dateSelected() in older versions of DDatePicker.

6.322.2.5 dateTable()

```
DDateTable * Digikam::DDatePicker::dateTable ( ) const
```

Returns

The DDateTable widget child of this DDatePicker widget.

6.322.2.6 fontSize()

```
int Digikam::DDatePicker::fontSize ( ) const
```

Returns

The font size of the widget elements.

6.322.2.7 hasCloseButton()

```
bool Digikam::DDatePicker::hasCloseButton ( ) const
```

Returns

True if a DDatePicker shows a close-button.

See also

setCloseButton

6.322.2.8 setCloseButton()

```
void Digikam::DDatePicker::setCloseButton (
            bool enable )
```

Clicking the close-button will cause the DDatePicker's topLevelWidget()'s close() method being called. This is mostly useful for toplevel datepickers without a window manager decoration.

See also

hasCloseButton

6.322.2.9 setDate()

```
bool Digikam::DDatePicker::setDate (
            const QDate & date )
```

Returns

False and does not change anything if the date given is invalid.

6.322.2.10 sizeHint()

```
QSize Digikam::DDatePicker::sizeHint ( ) const  [override]
```

The size hint recommends the minimum size of the widget so that all elements may be placed without clipping. This sometimes looks ugly, so when using the size hint, try adding 28 to each of the reported numbers of pixels.

6.323.1 Detailed Description

This menu helps the user to select a date quickly. It offers various ways of selecting, e.g. with a DDatePicker or with words like "Tomorrow".

The available items are:

- NoDate: A menu-item with "No Date". If chosen, the datepicker will emit a null QDate.
- DatePicker: Show a DDatePicker-widget.
- Words: Show items like "Today", "Tomorrow" or "Next Week".

When supplying multiple items, separate each item with a bitwise OR.

            const QDate & date = QDate::currentDate(),
            QWidget *const parent = nullptr )  [explicit]
```

Parameters

items	List of all desirable items, separated with a bitwise OR.
date	Initial date of datepicker-widget.
parent	The object's parent.

```

Returns

The bitwise result of the active items in the popup.

6.324.1 Detailed Description

It just draws the calendar table without titles, but could theoretically be used as a standalone.

When a date is selected by the user, it emits a signal: dateSelected(QDate)

6.324.2 Member Function Documentation

6.324.2.1 aboutToShowContextMenu

```
void Digikam::DDateTable::aboutToShowContextMenu (
            QMenu * menu,
            const QDate & dt )  [signal]
```

Connect the slot where you fill the menu to this signal.

6.324.2.2 date()

```
const QDate & Digikam::DDateTable::date ( ) const
```

Returns

The selected date.

6.324.2.3 dateFromPos()

```
QDate Digikam::DDateTable::dateFromPos (
            int pos )  [protected], [virtual]
```

pos is the 0-based index in the matrix. Inverse function to posForDate().

6.324.2.4 popupMenuEnabled()

```
bool Digikam::DDateTable::popupMenuEnabled ( ) const
```

Returns

If the popup menu is enabled or not

6.324.2.5 posFromDate()

```
int Digikam::DDateTable::posFromDate (
            const QDate & dt )  [protected], [virtual]
```

The result is the 0-based index.

6.324.2.6 selectedDateChanged

```
void Digikam::DDateTable::selectedDateChanged (
            const QDate & cur,
            const QDate & old )  [signal]
```

The selected date changed.

Parameters

cur	The current date
old	The date before the date was changed

6.324.2.7 setPopupMenuEnabled()

```
void Digikam::DDateTable::setPopupMenuEnabled (
            bool enable )
```

When it's enabled, this object emits a aboutToShowContextMenu signal where you can fill in the menu items.

6.324.2.8 sizeHint()

```
QSize Digikam::DDateTable::sizeHint ( ) const  [override]
```

Returns

A recommended size for the widget. To save some time, the size of the largest used cell content is calculated in each paintCell() call, since all calculations have to be done there anyway. The size is stored in maxCell. The sizeHint() simply returns a multiple of maxCell.

  For a loaded file in directory path and with file name filename, returns the directory in which a new version (a new intermediate version, resp.) shall be stored.
- virtual QVariant incrementedCounter (const QVariant &counter) override

  Returns the given counter "incremented", that is, changed in a steady, repeatable fashion.

Returns an initial counter value for version and intermediate number counters.

- virtual QString intermediateDirectory (const QString &currentPath, const QString &fileName) override
- virtual QString intermediateFileName (const QString &currentPath, const QString &filename, const QVariant &version, const QVariant &counter) override

- virtual QString versionFileName (const QString &currentPath, const QString &filename, const QVariant &counter) override

  Creates a version file name for a file in given directory, as previously returned by directory(), given baseName, as previously returned by baseName, and version counter.

Public Member Functions inherited from Digikam::VersionNamingScheme

- **VersionNamingScheme** ()=default

  Creates and analyzes file names of versioned files.

6.331.1 Member Function Documentation

6.331.1.1 baseName()

```
QString Digikam::DefaultVersionNamingScheme::baseName (
            const QString & path,
            const QString & filename,
            QVariant * counter,
            QVariant * intermediateCounter )  [override], [virtual]
```

Returns the basename in the sense of stripping the file name of all added version information: A scheme that appends a number, like "MyFile-1.jpg", shall return "MyFile". Path is the directory, filename the file name, so path + filename is the file path. If counter is given, and the given file name has a version number, write it to counter. If intermediateCounter is given, and the given file name has an intermediate counter number, write it to counter. If not available, do not touch the given counters. See initialCounter() for the valid counter formats.

6.345.1 Member Enumeration Documentation

6.345.1.1 DisplayFlag

enum Digikam::DFontProperties::DisplayFlag

- FixedFontsOnly only show fixed fonts, excluding proportional fonts
- DisplayFrame show a visual frame around the chooser
- ShowDifferences display the font differences interfaces

6.345.1.2 FontColumn

enum Digikam::DFontProperties::FontColumn

- FamilyList - Identifies the family (leftmost) list.
- StyleList - Identifies the style (center) list.
- SizeList - Identifies the size (rightmost) list.

6.345.1.3 FontDiff

enum Digikam::DFontProperties::FontDiff

- FontDiffFamily - Identifies a requested change in the font family.
- FontDiffStyle - Identifies a requested change in the font style.
- FontDiffSize - Identifies a requested change in the font size.

6.345.1.4 FontListCriteria

enum Digikam::DFontProperties::FontListCriteria

- FixedWidthFont when included only fixed-width fonts are returned. The fonts where the width of every character is equal.
- ScalableFont when included only scalable fonts are returned; certain configurations allow bitmap fonts to remain unscaled and thus these fonts have limited number of sizes.
- SmoothScalableFont when included only return smooth scalable fonts. this will return only non-bitmap fonts which are scalable to any size requested. Setting this option to true will mean the "scalable" flag is irrelevant.

6.345.2 Constructor & Destructor Documentation

6.345.2.1 DFontProperties()

```
Digikam::DFontProperties::DFontProperties (
            QWidget *const parent = nullptr,
            const DisplayFlags & flags = DisplayFrame,
            const QStringList & fontList = QStringList(),
            int visibleListSize = 8,
            Qt::CheckState *const sizeIsRelativeState = nullptr )  [explicit]
```

It normally comes up with all font families present on the system; the getFont method below does allow some more fine-tuning of the selection of fonts that will be displayed in the dialog.

Parameters

parent	The parent widget.
flags	Defines how the font chooser is displayed.

See also

DisplayFlags

Parameters

fontList	A list of fonts to display, in XLFD format.
visibleListSize	The minimum number of visible entries in the fontlists.
sizeIsRelativeState	If not zero the widget will show a checkbox where the user may choose whether the font size is to be interpreted as relative size. Initial state of this checkbox will be set according to ∗sizeIsRelativeState, user choice may be retrieved by calling sizeIsRelative().

            bool onlyFixed = false )
```

Parameters

font	The font to select.
onlyFixed	Readjust the font list to display only fixed width fonts if `true`, or vice-versa.

            const QList< QModelIndex > & indexes,
            int tagId )  [slot]
```

You aren't allowed to "confirm" a person as Ignored. Marking as Ignored is treated as a changeTag() operation.

6.353.1.3 hasHiddenGroupedImages()

6.354.1 Member Function Documentation

6.354.1.1 actionCount()

```
int Digikam::DImageHistory::actionCount ( ) const
```

Returns

The number of non-null actions

6.354.1.2 clearReferredImages()

```
void Digikam::DImageHistory::clearReferredImages ( )
```

Remove all referredImages, leaving the entries list untouched

6.354.1.3 entries()

```

There are size() entries.

6.354.1.4 hasActions()

```
bool Digikam::DImageHistory::hasActions ( ) const
```

There is one action per entry, but the action may be null.

Returns

True if there is any non-null action

6.354.1.5 operator<<()

```
DImageHistory & Digikam::DImageHistory::operator<< (
            const HistoryImageId & imageId )
```

If you add an id of type Current, adjustReferredImages() will be called.

6.354.1.6 purgePathFromReferredImages()

6.354.1.7 size()

```
int Digikam::DImageHistory::size ( ) const
```

Returns

The number of entries

6.354.1.8 toXml()

```
QString Digikam::DImageHistory::toXml ( ) const
```

Note

The "Current" entry is skipped when writing to XML, so make sure the file into the metadata of which you write the XML, is the file marked as "Current" in this history.

6.355 Digikam::DImageHistory::Entry Class Reference

Public Attributes

- FilterAction action

  A DImageHistory is a list of entries.
- QList< HistoryImageId > **referredImages**

6.355.1 Member Data Documentation

6.355.1.1 action

```
FilterAction Digikam::DImageHistory::Entry::action
```

Each entry has one action. The action can be null, but it shall be null only if it is the action of the first entry, with the "Original" as referred image, representing the action of digitization.

There can be zero, one or any number of referred images per entry. A referred image is a file in the state after the action is applied.

6.356.1 Member Enumeration Documentation

6.356.1.1 FORMAT

`enum Digikam::DImg::FORMAT`

Enumerator

QIMAGE	QImage or ImageMagick.

6.356.1.2 PrepareMetadataFlag

`enum Digikam::DImg::PrepareMetadataFlag`

This method updates the stored meta engine object in preparation to a subsequent call to save() with the same target file. 'intendedDestPath' is the finally intended file name. Do not give the temporary file name if you are going to save() to a temp file. 'destMimeType' is destination type mime. In some cases, metadata is updated depending on this value. 'originalFileName' is the original file's name, for simplistic history tracking in metadata. This is completely independent from the DImageHistory framework. For the 'flags' see below. Not all steps are optional and can be controlled with flags.

Enumerator

RemoveOldMetadataPreviews	A small preview can be stored in the metadata. Remove old preview entries

Enumerator

CreateNewMetadataPreview	Create a new preview from current image data.
ResetExifOrientationTag	Set the exif orientation tag to "normal" Applicable if the image data was rotated according to the tag.
CreateNewImageHistoryUUID	Creates a new UUID for the image history. Applicable if the file was changed.

6.356.2 Constructor & Destructor Documentation

6.356.2.1 DImg() [1/4]

`Digikam::DImg::DImg ( )`

DImg is a framework to support 16bits color depth image.

it doesn't aim to be a complete imaging library; it uses QImage/ImageMagick for load/save files which are not supported natively by it. some of the features:

- Native Image Loaders, for some imageformats which are of interest to us: JPEG (complete), TIFF (mostly complete), PNG (complete), JPEG2000 (complete), RAW (complete through libraw), PGF (complete). For the rest ImageMAgick codecs or qimageloader are used.
- Metadata preservation: when a file is loaded, its metadata like XMP, IPTC, EXIF, JFIF are read and held in memory. now when you save back the file to the original file or to a different file, the metadata is automatically written. All is delegate to Exiv2 library.
- Explicitly Shared Container format (see qt docs): this is necessary for performance reasons.
- 8 bits and 16 bits support: if the file format is 16 bits, it will load up the image in 16bits format (TIFF/PNG/↩ JPEG2000/RAW/PGF support) and all operations are done in 16 bits format, except when the rendering to screen is done, when its converted on the fly to a temporary 8 bits image and then rendered.
- Basic image manipulation: rotate, flip, color modifications, crop, scale. This has been ported from Imlib2 with 16 bits scaling support and support for scaling of only a section of the image.
- Rendering to Pixmap: using QImage/QPixmap. (see above for rendering of 16 bits images).
- Pixel format: the pixel format is different from QImage pixel format. In QImage the pixel data is stored as unsigned ints and to access the individual colors you need to use bit-shifting to ensure endian correctness. in DImg, the pixel data is stored as unsigned char. the color layout is B,G,R,A (blue, green, red, alpha)

for 8 bits images: you can access individual color components like this:

uchar∗ const pixels = image.bits();

for (int i = 0 ; i < image.width() ∗ image.height() ; ++i) { pixel[0] // blue pixel[1] // green pixel[2] // red pixel[3] // alpha

pixel += 4; // go to next pixel }

and for 16 bits images:

ushort∗ const pixels = (ushort∗)image.bits();

for (int i = 0 ; i < image.width() ∗ image.height() ; ++i) { pixel[0] // blue pixel[1] // green pixel[2] // red pixel[3] // alpha

pixel += 4; // go to next pixel }

The above is true for both big and little endian platforms. What this also means is that the pixel format is different from that of QImage for big endian machines. Functions are provided if you want to get a copy of the DImg as a QImage.

6.356.2.2 DImg() [2/4]

```
Digikam::DImg::DImg (
            const DImg & image )
```

The two images will be equal. Call detach() or copy() to create deep copies.

6.356.2.3 DImg() [3/4]

```
Digikam::DImg::DImg (
            const QImage & image )  [explicit]
```

If the QImage is null, a null DImg will be created.

6.356.2.4 DImg() [4/4]

```
Digikam::DImg::DImg (
            uint width,
            uint height,
            bool sixteenBit,
            bool alpha = false,
            uchar *const data = nullptr,
            bool copyData = true )
```

If data is 0, a new buffer will be allocated, otherwise the given data will be used: If copydata is true, the data will be copied to a newly allocated buffer. If copyData is false, this DImg object will take ownership of the data pointer. If there is an alpha channel, the data shall be in non-premultiplied form (unassociated alpha).

6.356.3 Member Function Documentation

6.356.3.1 addAsReferredImage()

```
HistoryImageId Digikam::DImg::addAsReferredImage (
            const QString & filePath,
            HistoryImageId::Type type = HistoryImageId::Intermediate )
```

First call updateMetadata(), then call save(), then call addAsReferredImage(). Do not call this directly after loading, before applying any changes: The history is correctly initialized when loading. If you need to insert the referred file to an entry which is not the last entry, which may happen if the added image was saved after this image's history was created, you can use insertAsReferredImage. The added id is returned.

6.356.3.2 addCurrentUniqueImageId()

```
void Digikam::DImg::addCurrentUniqueImageId (
            const QString & uuid )
```

Call this if you have associated a UUID with this file which is not written to the metadata. If there is already a UUID present, read from metadata, it will not be replaced.

6.356.3.3 bitBlendImage()

```
void Digikam::DImg::bitBlendImage (
            DColorComposer *const composer,
            const DImg *const src,
            int sx,
            int sy,
            int w,
            int h,
            int dx,
            int dy,
            DColorComposer::MultiplicationFlags multiplicationFlags = DColorComposer::NoMultiplication
)
```

See documentation of DColorComposer for more info. For the other arguments, see documentation of bitBltImage above.

6.356.3.4 bitBlendImageOnColor()

```
void Digikam::DImg::bitBlendImageOnColor (
            DColorComposer *const composer,
            const DColor & color,
            int x,
            int y,
            int w,
            int h,
            DColorComposer::MultiplicationFlags multiplicationFlags = DColorComposer::NoMultiplication
)
```

See documentation of DColorComposer for more info. Note that the result pixel is again written to this image, which is, for the blending, source.

6.356.3.5 bitBltImage()

```
void Digikam::DImg::bitBltImage (
            const DImg *const src,
            int dx,
            int dy )
```

Parameters: sx|sy Coordinates in the source image of the rectangle to be copied w h Width and height of the rectangle (Default, or when both are -1: whole source image) dx|dy Coordinates in this image of the rectangle in which the region will be copied (Default: 0|0) The bit depth of source and destination must be identical.

6.356.3.6 bitsDepth()

```
int Digikam::DImg::bitsDepth ( ) const
```

Returns

The number of bits depth of one color component for one pixel : 8 (non sixteenBit) or 16 (sixteen)

6.356.3.7 bytesDepth()

```
int Digikam::DImg::bytesDepth ( ) const
```

Returns

The number of bytes depth of one pixel : 4 (non sixteenBit) or 8 (sixteen)

6.356.3.8 convertDepth()

```
void Digikam::DImg::convertDepth (
            int depth )
```

Depth is bytesDepth ∗ bitsDepth. If depth is 32, converts to 8 bits, if depth is 64, converts to 16 bits.

6.356.3.9 copy() [1/2]

```
DImg Digikam::DImg::copy ( ) const
```

Returns

A deep copy of full image

6.356.3.10 copy() [2/2]

```
DImg Digikam::DImg::copy (
            const QRect & rect ) const
```

Returns

A region of image

6.356.3.11 copyImageData()

```
DImg Digikam::DImg::copyImageData ( ) const
```

Returns

A deep copy of the image, but do not include metadata.

6.356.3.12 copyMetaData()

```
DImg Digikam::DImg::copyMetaData ( ) const
```

Returns

An image that contains a deep copy of this image's metadata and the information associated with the image data (width, height, hasAlpha, sixteenBit), but no image data, i.e. isNull() is true.

6.356.3.13 createImageUniqueId()

```
QByteArray Digikam::DImg::createImageUniqueId ( )
```

The UUID will be returned as a 64-byte hexadecimal string. At least 128bits of the UUID will be created by the platform random number generator. The rest may be created from a content-based hash similar to the uniqueHash, see above. This method only generates a new UUID for this image without in any way changing this image object or saving the UUID anywhere.

6.356.3.14 detach()

```
void Digikam::DImg::detach ( )
```

If multiple images share common data, this image makes a copy of the data and detaches itself from the sharing mechanism. Nothing is done if there is just a single reference.

6.356.3.15 detectedFormat()

```
DImg::FORMAT Digikam::DImg::detectedFormat ( ) const
```

Returns

The file format in form of the FORMAT enum that was detected in the load() method. Other than the format attribute which is written by the DImgLoader, this can include the QIMAGE or NONE values. NONE is returned for images that have not been loaded. For unknown image formats, a value of QIMAGE can be returned to indicate that the QImage-based loader will have been used. To find out if this has worked, check the return value you got from load().

6.356.3.16 fileOriginData()

```
QVariant Digikam::DImg::fileOriginData ( ) const
```

When saving in a different format to a different file, you may wish to switch these attributes to the new file.

See also

fileOriginData returns the current origin data, bundled in the returned QVariant.

setFileOriginData takes such a variant and adjusts the properties.

lastSavedFileOriginData returns the origin data as if the image was loaded from the last saved image.

switchOriginToLastSaved is equivalent to setting origin data returned from

lastSavedFileOriginData.

For example, an image loaded from a RAW and saved to PNG will be read-only and format RAW. After calling

See also

switchOriginToLastSaved, it will not be read-only, format will be PNG, and

rawDecodingSettings will be null.

detectedFormat will not change. In the history, the last referred image that was added (as intermediate) is made the new Current image.

Note

Set the saved image path with

See also

imageSavedAs before!

6.356.3.17 fill()

```
void Digikam::DImg::fill (
            const DColor & color )
```

The bit depth of the color must be identical to the depth of this image.

6.356.3.18 format()

```
QString Digikam::DImg::format ( ) const
```

Returns

The format string as written by the image loader this image was originally loaded from. Format strings used include JPEG, PNG, TIFF, PGF, JP2K, RAW, PPM. For images loaded with the platform QImage loader, the file suffix is used. Returns null if this DImg was not loaded from a file, but created in memory.

6.356.3.19 getPixelColor()

```
DColor Digikam::DImg::getPixelColor (
            uint x,
            uint y ) const
```

These functions add some safety checks and then use the methods from DColor. In optimized code working directly on the data, better use the inline methods from DColor.

6.356.3.20 getUniqueHash()

```
QByteArray Digikam::DImg::getUniqueHash ( )
```

The hash is calculated on parts of the file and the file metadata. It cannot be used to find similar images. It is not calculated from the image data. The hash will be returned as a 32-byte hexadecimal string.

If you already have a DImg object of the file, use the member method. The object does not need to have the full image data loaded, but it shall at least have been loaded with loadItemInfo with loadMetadata = true, or have the metadata set later with setComments, setExif, setIptc, setXmp. If the object does not have the metadata loaded, a non-null, but invalid hash will be returned! In this case, use the static method. If the image has been loaded with loadUniqueHash = true, the hash can be retrieved with the member method.

You do not need a DImg object of the file to retrieve the unique hash; Use the static method and pass just the file path.

6.356.3.21 getUniqueHashVersion()

```
QByteArray Digikam::DImg::getUniqueHashVersion (
            int version )
```

The hash is calculated on parts of the file. It cannot be used to find similar images. It is not calculated from the image data. The hash will be returned as a 32-byte hexadecimal string.

Version 3: This methods return a 128-bit MD5 hex digest which is meant to uniquely identify the file. It cannot be used to find similar images. The hash is calculated from 6 blocks distributed across the file, the first block has a size of 100 kB (capture metadata), all other possible 5 blocks up to 25 kB. The hash will be returned as a 32-byte hexadecimal string.

If you already have a DImg object loaded from the file, use the member method. If the image has been loaded with loadUniqueHash = true, the hash will already be available.

You do not need a DImg object of the file to retrieve the unique hash; Use the static method and pass just the file path and version.

6.356.3.22 hasTransparentPixels()

```
bool Digikam::DImg::hasTransparentPixels ( ) const
```

Note that all pixels are scanned to reach a return value of "false". If hasAlpha() is false, always returns false.

6.356.3.23 imageSavedAs()

```
void Digikam::DImg::imageSavedAs (
            const QString & savePath )
```

For this reason, save() does not call addAsReferredImage(), and the stored save path may be wrong. Call this method after save() with the final destination path. This path will be stored in the image history as well.

6.356.3.24 isAnimatedImage()

```
bool Digikam::DImg::isAnimatedImage (
            const QString & filePath )  [static]
```

Returns

True if image file is an animation, as GIFa or NMG

6.356.3.25 isReadOnly()

```
bool Digikam::DImg::isReadOnly ( ) const
```

Returns

True if the original image file format cannot be saved. This is depending of DImgLoader::save() implementation. For example RAW file formats are supported by DImg using dcraw than cannot support writing operations.

6.356.3.26 lastSavedFilePath()

```
QString Digikam::DImg::lastSavedFilePath ( ) const
```

Returns

The file path to which this DImg was saved. The file path set with imageSavedAs() is returned if that was not called, else save() if that was not called, a null string.

6.356.3.27 loadItemInfo()

```
bool Digikam::DImg::loadItemInfo (
            const QString & filePath,
            bool loadMetadata = true,
            bool loadICCData = true,
            bool loadUniqueHash = true,
            bool loadImageHistory = true )
```

If loadMetadata is true, the metadata will be available with getComments, getExif, getIptc, getXmp . If loadICCData is true, the ICC profile will be available with getICCProfile.

6.356.3.28 operator==()

```
bool Digikam::DImg::operator== (
            const DImg & image ) const
```

Returns

whether two images are equal. Two images are equal if and only if they refer to the same shared data. (Thus, DImg() == DImg() is not true, both instances refer two their own shared data. image == DImg(image) is true.) If two or more images refer to the same data, they have the same image data, bits() returns the same data, they have the same metadata, and a change to one image also affects the others. Call detach() to split one image from the group of equal images.

6.356.3.29 orientation()

```
int Digikam::DImg::orientation ( ) const
```

Returns

Current DMetadata::Orientation from DImg

6.356.3.30 originalBitDepth()

```
int Digikam::DImg::originalBitDepth ( ) const
```

Returns

The bit depth (in bits per channel, e.g. 8 or 16) of the original file.

6.356.3.31 originalColorModel()

```
DImg::COLORMODEL Digikam::DImg::originalColorModel ( ) const
```

Returns

The color model in which the image was stored in the file. The color space of the loaded image data is always RGB.

6.356.3.32 originalFilePath()

```
QString Digikam::DImg::originalFilePath ( ) const
```

Returns

The file path from which this DImg was originally loaded or a null string if the DImg was not loaded from a file.

6.356.3.33 originalRatioSize()

```
QSize Digikam::DImg::originalRatioSize ( ) const
```

Returns

the size of the original file in the same aspect ratio as size().

6.356.3.34 originalSize()

```
QSize Digikam::DImg::originalSize ( ) const
```

Returns

The size of the original file.

6.356.3.35 prepareMetadataToSave()

```
void Digikam::DImg::prepareMetadataToSave (
            const QString & intendedDestPath,
            const QString & destMimeType,
            bool resetExifOrientationTag )
```

Uses originalFilePath() to fill the original file name.

6.356.3.36 pureColorMask()

```
QImage Digikam::DImg::pureColorMask (
            ExposureSettingsContainer *const expoSettings ) const
```

Returns

A mask image where pure white and pure black pixels are over-colored. This way is used to identify over and under exposed pixels.

6.356.3.37 putImageData() [1/2]

```
void Digikam::DImg::putImageData (
            uchar *const data,
            bool copyData = true )
```

Uses current width, height, sixteenBit, and alpha values. If data is nullptr, the current data are deleted and the image is set to null (But metadata are unchanged).

6.356.3.38 putImageData() [2/2]

```
void Digikam::DImg::putImageData (
            uint width,
            uint height,
            bool sixteenBit,
            bool alpha,
            uchar *const data,
            bool copyData = true )
```

Metadata are unchanged. Parameters like constructor above.

6.356.3.39 rawDecodingSettings()

```
DRawDecoding Digikam::DImg::rawDecodingSettings ( ) const
```

Returns

The DRawDecoding options that this DImg was loaded with. If this is not a RAW image or no options were specified, returns DRawDecoding().

6.356.3.40 removeAlphaChannel()

```
void Digikam::DImg::removeAlphaChannel (
            const DColor & destColor )
```

This is a no-op if hasTransparentPixels() is false, but this method can be expensive, therefore it is *not* checked inside removeAlphaChannel(). (the trivial hasAlpha() is checked)

6.356.3.41 rotateAndFlip()

```
bool Digikam::DImg::rotateAndFlip (
            int orientation )
```

Returns

True if the image was actually rotated or flipped (e.g. if ORIENTATION_NORMAL is given, returns false, because no action is taken).

6.356.3.42 savedFormat()

```
QString Digikam::DImg::savedFormat ( ) const
```

Returns

The format string of the format that this image was last saved to. An image can be loaded from a file - retrieve that format with fileFormat() and loadedFormat() - and can the multiple times be saved to different formats. Format strings used include JPG, PGF, PNG, TIFF and JP2K. If this file was not save, a null string is returned.

6.356.3.43 setHistoryBranchAfter()

```
void Digikam::DImg::setHistoryBranchAfter (
            const DImageHistory & historyBeforeBranch,
            bool isBranch = true )
```

Use setHistoryBranch() to take getOriginalImageHistory() and set the first added step as a branch. Use setHistory↩ BranchForLastSteps(n) to start the branch before the last n steps in the history. (Assume the history had 3 steps and you added 2, call setHistoryBranchForLastSteps(2)) Use setHistoryBranchAfter() if have a copy of the history before branching, the first added step on top of that history will be made a branch.

6.356.3.44 smoothScale()

```
DImg Digikam::DImg::smoothScale (
            int width,
            int height,
            Qt::AspectRatioMode aspectRatioMode = Qt::IgnoreAspectRatio ) const
```

Returns

A version of this image scaled to the specified size with the specified mode. See QSize documentation for information on available modes

6.356.3.45 smoothScaleClipped()

```
DImg Digikam::DImg::smoothScaleClipped (
            int width,
            int height,
            int clipx,
            int clipy,
            int clipwidth,
            int clipheight,
            bool smooth = true ) const
```

This is thus equivalent to calling Dimg scaled = smoothScale(width, height); scaled.crop(clipx, clipy, clipwidth, clipheight); but potentially much faster. In smoothScaleSection, you specify the source region, here, the result region. It will often not be possible to find *integer* source coordinates for a result region!

6.356.3.46 stripImageData()

```
uchar * Digikam::DImg::stripImageData ( )
```

Returns

The data of this image. Ownership of the buffer is passed to the caller, this image will be null afterwards.

6.356.3.47 transform()

```
bool Digikam::DImg::transform (
            int transformAction )
```

Returns

True if the image was actually rotated or flipped.

6.356.3.48 wasExifRotated()

```
bool Digikam::DImg::wasExifRotated ( )
```

Detects if an image has previously already been rotated: You can call this method more than one time on the same image.

Returns

True if the image has actually been rotated or flipped. or false if a rotation was not needed.

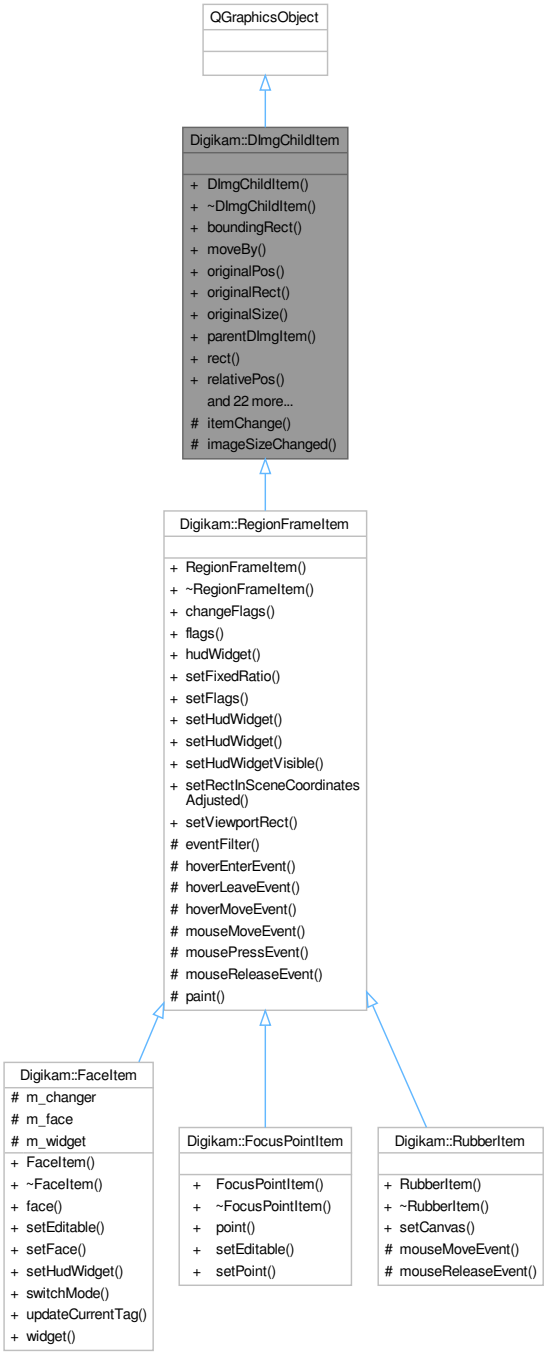
6.358 Digikam::DImgChildItem Class Reference

Inheritance diagram for Digikam::DImgChildItem:



Signals

- void **geometryChanged** ()
- void **geometryOnImageChanged** ()

- void positionChanged ()

  These signals are emitted in any case when the geometry changed: Either after changing the geometry relative to the original image, or when the size of the parent GraphicsDImgItem changed (zooming).
- void positionOnImageChanged ()

  These signals are emitted when the geometry, relative to the original image, of this item has changed.
- void **sizeChanged** ()
- void **sizeOnImageChanged** ()

Public Member Functions

- DImgChildItem (QGraphicsItem *const parent=nullptr)

  This is a base class for items that are positioned on top of a GraphicsDImgItem, positioned in relative coordinates, i.e.

6.358.1 Constructor & Destructor Documentation

6.358.1.1 DImgChildItem()

```
Digikam::DImgChildItem::DImgChildItem (
            QGraphicsItem *const parent = nullptr )  [explicit]
```

[0;1], on the image. From the set relative size, the boundingRect() is calculated.

6.358.2 Member Function Documentation

6.358.2.1 boundingRect()

```
QRectF Digikam::DImgChildItem::boundingRect ( ) const  [override]
```

Returns a rectangle starting at (0,0) (pos() in parent coordinates) and has a size determined by the relative size.

6.358.2.2 originalRect()

```
QRect Digikam::DImgChildItem::originalRect ( ) const
```

Note that the return value is integer based. At high zoom rates, different values of relativeRect() or zoomedRect() may result in the same originalRect(), when one pixel in the original is represented by more than one pixel on screen.

6.358.2.3 positionChanged

```
void Digikam::DImgChildItem::positionChanged ( )  [signal]
```

positionChanged() is equivalent to listening to xChanged() and yChanged().

6.358.2.4 positionOnImageChanged

```
void Digikam::DImgChildItem::positionOnImageChanged ( )  [signal]
```

This happens by calling any of the methods above.

6.358.2.5 rect()

```
QRectF Digikam::DImgChildItem::rect ( ) const
```

This is the same result as QRectF(pos(), boundingRect()), boundingRect is virtual and may be overridden by base classes.

6.358.2.6 relativeRect()

```
QRectF Digikam::DImgChildItem::relativeRect ( ) const
```

All four values are in the interval [0;1].

6.358.2.7 setOriginalPos()

```
void Digikam::DImgChildItem::setOriginalPos (
            const QPointF & posInOriginal )
```

Requires a valid parent item.

6.358.2.8 setPos()

```
void Digikam::DImgChildItem::setPos (
            const QPointF & zoomedPos )
```

This is accepting unscaled parent coordinates, just like the "normal" setPos() does. Requires a valid parent item.

6.358.2.9 setRelativePos()

```
void Digikam::DImgChildItem::setRelativePos (
            const QPointF & relativePosition )
```

The values of relativePosition must be in the interval [0;1].

6.366.1 Constructor & Destructor Documentation

6.366.1.1 DImgThreadedFilter() [1/3]

```
Digikam::DImgThreadedFilter::DImgThreadedFilter (
            QObject *const parent = nullptr,
            const QString & name = QString() )  [explicit]
```

You need to call setupFilter() and startFilter() to start the threaded computation. To run filter without to use multithreading, call startFilterDirectly().

6.366.1.2 DImgThreadedFilter() [2/3]

```
Digikam::DImgThreadedFilter::DImgThreadedFilter (
            DImg *const orgImage,
            QObject *const parent,
            const QString & name = QString() )
```

The given original image will be copied. You need to call startFilter() to start the threaded computation. To run filter without to use multithreading, call startFilterDirectly().

6.366.1.3 DImgThreadedFilter() [3/3]

```
Digikam::DImgThreadedFilter::DImgThreadedFilter (
            DImgThreadedFilter *const master,
            const DImg & orgImage,
            const DImg & destImage,
            int progressBegin = 0,
            int progressEnd = 100,
            const QString & name = QString() )  [protected]
```

Do not call startFilter() or startFilterDirectly() on this. The computation will be started from initFilter() which you must call from the derived class constructor.

Constructor for slave mode: Constructs a new slave filter with the specified master. The filter will be executed in the current thread. orgImage and destImage will not be copied. Note that the slave is still free to reallocate his dest↩ Image. progressBegin and progressEnd can indicate the progress span that the slave filter uses in the parent filter's progress. Any derived filter class that is publicly available to other filters should implement an additional constructor using this constructor.

```

Override in subclass.

6.366.2.6 initFilter()

```
void Digikam::DImgThreadedFilter::initFilter ( )  [protected], [virtual]
```

6.366.2.7 initSlave()

```
void Digikam::DImgThreadedFilter::initSlave (
            DImgThreadedFilter *const master,
            int progressBegin = 0,
            int progressEnd = 100 )  [protected]
```

Note

Computation will be started from setupFilter().

6.366.2.8 modulateProgress()

```
int Digikam::DImgThreadedFilter::modulateProgress (
            int progress )  [protected], [virtual]
```

Called by postProgress if master is not null.

6.366.2.9 multithreadedSteps()

```
QList< int > Digikam::DImgThreadedFilter::multithreadedSteps (
            int stop,
            int start = 0 ) const
```

Usually, start and stop are rows or columns from image to process. By default, whole image will be processed and start value is 0. In this case stop will be last row or column to process. Between range [start,stop], this method will divide by equal steps depending of number of CPU cores available. To be sure that all values will be processed, in case of CPU core division give rest, the last step compensate the difference. See Blur filter loop implementation for example to see how to use this method with QtConcurrents API.

6.366.2.10 parametersSuccessfullyRead()

```
bool Digikam::DImgThreadedFilter::parametersSuccessfullyRead ( ) const  [virtual]
```

When readParameters() has been called, this method will return true if the call was successful, and false if not. If returning false, readParametersError() will give an error message. The default implementation always returns success. You only need to reimplement when a filter is likely to fail in a different environment, e.g. depending on availability of installed files. These methods have an undefined return value if readParameters() was not called previously.

Reimplemented in Digikam::IccTransformFilter.

6.366.2.11 postProgress()

```
void Digikam::DImgThreadedFilter::postProgress (
            int progress )  [protected], [virtual]
```

Reimplemented in Digikam::RawProcessingFilter.

6.366.2.12 run()

```
void Digikam::DImgThreadedFilter::run ( )  [override], [protected], [virtual]
```

Implements Digikam::DynamicThread.

6.366.2.13 setFilterVersion()

```
void Digikam::DImgThreadedFilter::setFilterVersion (
            int version )
```

A filter may implement different versions, to preserve image history when the algorithm is changed. Any value set here must be contained in supportedVersions, otherwise this call will be ignored. Default value is 1.

Note

If you intend to *record* a filter action, please look at FilterAction's m_version

6.366.2.14 setSlave()

```
void Digikam::DImgThreadedFilter::setSlave (
            DImgThreadedFilter *const slave )  [protected]
```

At destruction of the slave, call with slave=0.

6.366.2.15 setupFilter()

```
void Digikam::DImgThreadedFilter::setupFilter (
            const DImg & orgImage )
```

The original image's data will not be copied.

6.366.2.16 signalFinished

```
void Digikam::DImgThreadedFilter::signalFinished (
            bool success )  [signal]
```

Parameters

success	True if computation finished without interruption on valid data False if the thread was canceled, or no data is available.

6.366.3 Member Data Documentation

6.366.3.1 m_master

```
DImgThreadedFilter* Digikam::DImgThreadedFilter::m_master = nullptr  [protected]
```

Progress info will be routed to this one.

6.366.3.2 m_slave

```
DImgThreadedFilter* Digikam::DImgThreadedFilter::m_slave = nullptr  [protected]
```

Any filter might want to use another filter while processing.

FullWrite	Write all available information.
FullWriteIfChanged	Do a full write if and only if. • metadata fields changed • the changed fields shall be written according to write settings "Changed" in this context means changed by one of the set... methods, the load() methods are ignored for this attribute. This mode allows to avoid write operations when e.g. the user does not want keywords to be written and only changes keywords.
PartialWrite	Write only the changed parts. Metadata fields which cannot be changed from MetadataHub (photographer ID etc.) will never be written

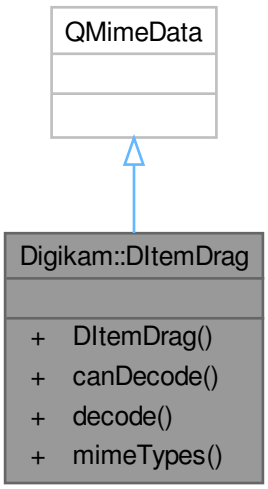
6.377 Digikam::DItemDrag Class Reference

Provides a drag object with additional information for internal drag&drop.

Inheritance diagram for Digikam::DItemDrag:



Public Member Functions

- **DItemDrag** (const QList< QUrl > &urls, const QList< int > &albumIDs, const QList< qlonglong > &image↩ IDs)

6.377.1 Detailed Description

Images can be moved through ItemDrag. It is possible to move them on another application which is supported through QT to e.g. copy the images. digiKam can use the IDs, if ItemDrag is dropped on digikam itself. The urls set via setUrls() are used for external drops (k3b, gimp, ...)

6.378.1 Detailed Description

The easy way to use this container is given below:

// READ INFO FROM HOST ----------

QUrl itemUrl; // The item url that you want to retrieve information. DInfoInterface* hostIface; // The host application interface instance.

DInfoInterface::DInfoMap info = hostIface->itemInfo(itemUrl); // First stage is to get the information map from host application. DItemInfo item(info); // Second stage, is to create the DIntenInfo instance for this item by url. QString title = item.name(); // Now you can retrieve the title, QString description = item.comment(); // The comment, QDateTime time = item.dateTime(); // The time stamp, etc.

// WRITE INFO TO HOST ----------

QUrl itemUrl; // The item url that you want to retrieve information. DInfoInterface* hostIface; // The host application interface instance.

DItemInfo item; // Create the DIntenInfo instance for this item with an empty internal info map. item.setRating(3); // Store rating to internal info map. item.setColorLabel(1); // Store color label to internal info map. hostIface->set↩ ItemInfo(url, item.infoMap()); // Update item information to host using internal info map.

6.412.3.17 moveNear()

```
void Digikam::DNotificationPopup::moveNear (
            const QRect & target )  [protected]
```

The popup will be placed adjacent to, but outside of, `target`, without going off the current desktop.

Reimplementations of positionSelf() can use this to actually position the popup.

6.412.3.18 positionSelf()

```
void Digikam::DNotificationPopup::positionSelf ( )  [protected], [virtual]
```

The default implementation attempts to place it by the taskbar entry; failing that it places it by the window of the associated widget; failing that it places it at the location given by defaultLocation().

6.412.3.19 setAnchor()

```
void Digikam::DNotificationPopup::setAnchor (

6.412.3.20 setAutoDelete()

```
void Digikam::DNotificationPopup::setAutoDelete (
            bool autoDelete )  [virtual]
```

The default is false (unless created by one of the static message() overloads).

6.412.3.22 setTimeout

```
void Digikam::DNotificationPopup::setTimeout (
            int delay )  [slot]
```

Setting the delay to 0 disables the timeout, if you're doing this, you may want to connect the clicked() signal to the hide() slot. Setting the delay to -1 makes it use the default value.

timeout

6.412.3.23 standardView()

```
QWidget * Digikam::DNotificationPopup::standardView (
            const QString & caption,
            const QString & text,
            const QPixmap & icon,
            QWidget * parent = nullptr )
```

You can use the returned widget to customize the passivepopup while keeping the look similar to the "standard" passivepopups.

After customizing the widget, pass it to setView(QWidget*)

Parameters

caption	The window caption (title) on the popup
text	The text for the popup
icon	The icon to use for the popup
parent	The parent widget used for the returned widget. If left 0, then "this", i.e. the passive popup object will be used.

Returns

a QWidget containing the given arguments, looking like the standard passivepopups. The returned widget contains a QVBoxLayout, which is accessible through layout().

6.420.1 Detailed Description

Widget size can be constrained with the number of visible lines. A single line constraint will emulate QLine↩ Edit. See setLinesVisible() for details. The maximum number of characters can be limited with setMaxLenght(). The characters can be limited in editor by setIgnoredCharacters() and setAcceptedCharacters(). Implementation: dplaintextedit.cpp

6.420.2 Constructor & Destructor Documentation

6.420.2.1 DPlainTextEdit()

```
Digikam::DPlainTextEdit::DPlainTextEdit (
            unsigned int lines,
            QWidget *const parent = nullptr )  [explicit]
```

Zero lines do not apply a size constraint.

6.420.3 Member Function Documentation

6.420.3.1 acceptedCharacters()

```
QString Digikam::DPlainTextEdit::acceptedCharacters ( ) const
```

The mask of characters is passed as string (ex: "abcABC"). By default the mask is empty.

6.420.3.2 ignoredCharacters()

```
QString Digikam::DPlainTextEdit::ignoredCharacters ( ) const
```

The mask of characters is passed as string (ex: "+/!()"). By default the mask is empty.

6.420.3.3 isClearButtonEnabled()

```
bool Digikam::DPlainTextEdit::isClearButtonEnabled ( ) const
```

If enabled, the edit widget displays a trailing clear button when it contains some text, otherwise the edit widget does not show a clear button. This option only take effect in QLineEdit emulation mode when lines visible is set to 1. See setLinesVisible() for details.

6.420.3.4 returnPressed

```
void Digikam::DPlainTextEdit::returnPressed ( )  [signal]
```

See setLinesVisible() for details.

6.420.3.5 setCurrentLanguage()

```
void Digikam::DPlainTextEdit::setCurrentLanguage (
            const QString & lang )
```

If this property is not set, spell-checker will try to auto-detect language by parsing the text. To reset this setting, pass a empty string as language. If Sonnet dependencies is not resolved, this method does nothing.

6.420.3.6 setLinesVisible()

```
void Digikam::DPlainTextEdit::setLinesVisible (
            unsigned int lines )
```

Lines must be superior or equal to 1 to apply a size constraint. Notes: if a single visible line is used, the widget emulate QLineEdit. a null value do not apply a size constraint.

6.420.3.7 setMaxLength()

```
void Digikam::DPlainTextEdit::setMaxLength (
            int length )
```

By default no limit is set. A zero length reset a limit.

6.420.3.8 spellCheckSettings()

```
LocalizeContainer Digikam::DPlainTextEdit::spellCheckSettings ( ) const
```

See LocalizeContainer class for details.

6.420.3.9 text()

```
QString Digikam::DPlainTextEdit::text ( ) const
```

If ignored or accepted characters masks are set, text is filtered accordingly.
