6.1067.1 Detailed Description

It implements RAW post processing. Additionally, it provides some facilities for use from the DImg Raw loader.

The original image shall come from RawEngine without further modification.

6.1067.2 Constructor & Destructor Documentation

6.1067.2.1 RawProcessingFilter() [1/2]

```
Digikam::RawProcessingFilter::RawProcessingFilter (
            QObject *const parent = nullptr )  [explicit]
```

You need to call setSettings() and setOriginalImage() before starting the filter.

6.1067.2.2 RawProcessingFilter() [2/2]

```
Digikam::RawProcessingFilter::RawProcessingFilter (
            const DRawDecoding & settings,
            DImgThreadedFilter *const master,
            const DImg & orgImage,
            const DImg & destImage,
            int progressBegin = 0,
            int progressEnd = 100,
            const QString & name = QString() )
```

Computation is started immediately.

6.1067.3 Member Function Documentation

6.1067.3.1 filterAction()

```
FilterAction Digikam::RawProcessingFilter::filterAction ( )  [override], [virtual]
```

Returns

The action description corresponding to currently set options.

Implements Digikam::DImgThreadedFilter.

6.1067.3.2 filterIdentifier()

```
QString Digikam::RawProcessingFilter::filterIdentifier ( ) const  [inline], [override], [virtual]
```

6.1067.3.4 postProgress()

```
void Digikam::RawProcessingFilter::postProgress (
            int progress )  [override], [protected], [virtual]
```

Reimplemented from Digikam::DImgThreadedFilter.

6.1067.3.5 readParameters()

```
void Digikam::RawProcessingFilter::readParameters (
            const FilterAction & action )  [override], [virtual]
```

Implements Digikam::DImgThreadedFilter.

6.1067.3.6 setObserver()

```
void Digikam::RawProcessingFilter::setObserver (
            DImgLoaderObserver *const observer,
            int progressBegin,
            int progressEnd )
```

Here, as an alternative, a DImgLoaderObserver is set. It's continueQuery is called and progress is posted in the given interval.

6.1067.3.7 setSettings()

```
void Digikam::RawProcessingFilter::setSettings (
            const DRawDecoding & settings )
```

The post processing is carried out here, the libraw settings are needed to construct the FilterAction.

6.1076.1.1 setHudWidget()

```
void Digikam::RegionFrameItem::setHudWidget (
            QGraphicsWidget *const hudWidget )
```

A HUD item will be positioned relative to this item, and repositioned on position changes or resizing. Ownership of the item is taken, and it is made a child item of this item. You can also add QWidget directly. It will be wrapped in a proxy item.

6.1076.1.2 setViewportRect

```
void Digikam::RegionFrameItem::setViewportRect (
            const QRectF & rect )  [slot]
```

This can only be done for *one* region at a time. Set the current primary view region of the scene by this method to dynamically reposition the HUD inside this region. The rect given is in scene coordinates.

6.1087.1 Detailed Description

The RGTagModel class is a wrapper above QAbstractItemModel. It helds data for the tag tree displayed in ReverseGeocodingWidget. The model gets the data from the tag model of host application and displays it in a QTreeView. It stores three type of tags: old tags (the tags that belong to the host's tag model), spacer tags (tags representing address elements or custom tags) and new tags (tags containing data retrieved from backend).

6.1087.2 Constructor & Destructor Documentation

6.1087.2.1 RGTagModel()

```
Digikam::RGTagModel::RGTagModel (
            QAbstractItemModel *const externalTagModel,
            QObject *const parent = nullptr )  [explicit]
```

Parameters

externalTagModel	The tag model found in the host application.
parent	The parent object

6.1087.3 Member Function Documentation

6.1087.3.1 addDataInTree()

```
void Digikam::RGTagModel::addDataInTree (
            TreeBranch * currentBranch,
            int currentRow,
            const QStringList & addressElements,
            const QStringList & elementsData )
```

When it finds a spacer containing an address element, it looks to see if the address element is found in address↩ Elements list. If it's found, a new tag is added.

Parameters

currentBranch	The branch from where the scan starts.
currentRow	The row of the current branch.
addressElements	A list containing address elements. Example: {Country}, {City}...
elementsData	A list containing the name of each address element found in elements. Example: France, Paris...

6.1087.3.2 addExternalTags()

```
void Digikam::RGTagModel::addExternalTags (
            TreeBranch * parentBranch,
            int currentRow )
```

Parameters

parentBranch	The branch that will be parent for the old tag.
currentRow	The row where this external tag will be added.

6.1087.3.3 addNewData()

```
QList< QList< TagData > > Digikam::RGTagModel::addNewData (
            const QStringList & elements,
            const QStringList & resultedData )
```

The function starts to scan the tree from root level. When it finds a spacer containing an address element, it looks to see if the address element is found in elements list. If it's found, a new tag is added.

Parameters

elements	A list containing address elements. Example: {Country}, {City}...
resultedData	A list containing the name of each address element found in elements. Example: France, Paris...

Returns

A list containing new tags

6.1087.3.4 addNewTag()

```

            const QModelIndex & parent,
            const QString & spacerName )
```

parent	The index of the parent. If parent == QModelIndex(), then the spacer is added to top-level
spacerName	The name of the spacer. If it's an address element, the address element name will have the form {addressElement}.For example: {Country}, {City}...

6.1087.3.6 branchFromIndex()

```

Address means the path from rootTag to currentBranch.

Parameters

currentBranch	The branch from where the search starts.

6.1087.3.8 deleteAllSpacersOrNewTags()

```
void Digikam::RGTagModel::deleteAllSpacersOrNewTags (
            const QModelIndex & currentIndex,
            Type whatShouldRemove )
```

Parameters

            Type whatShouldRemove )
```

Parameters

6.1090.1 Member Function Documentation

6.1090.1.1 addToken()

```
bool Digikam::Rule::addToken (
            const QString & id,
            const QString & description,
            const QString & actionName = QString() )  [protected]
```

Parameters

id	the token id string (used for parsing)
description	the description of the token (used for example in the tooltip)
actionName	[optional] the name of the token action (only used when the token menu is displayed)

Returns

6.1090.1.2 escapeToken()

```
QString Digikam::Rule::escapeToken (
            const QString & token )  [static]
```

Parameters

token	the token to be escaped

Returns

A token with escaped characters. This token can then be used in a regular expression

6.1090.1.3 isValid()

```
bool Digikam::Rule::isValid ( ) const
```

Returns

true if valid

6.1090.1.4 parseOperation()

```
virtual QString Digikam::Rule::parseOperation (
            ParseSettings & settings,
            const QRegularExpressionMatch & match )  [protected], [pure virtual]
```

Parameters

settings	contains settings
match	result of the regular expression match done in Option::parse()

Returns

Implemented in Digikam::CaseModifier, Digikam::DateFormatModifier, Digikam::DefaultValueModifier, Digikam::RangeModifier, Digikam::RemoveDoublesModifier, Digikam::ReplaceModifier, Digikam::TrimmedModifier, Digikam::UniqueModifier, Digikam::CameraNameOption, Digikam::DatabaseOption, Digikam::DateOption, Digikam::DirectoryNameOption, Digikam::FilePropertiesOption, Digikam::MetadataOption, Digikam::SequenceNumberOption, Digikam::Modifier, and Digikam::Option.

6.1090.1.5 regExp()

```
QRegularExpression & Digikam::Rule::regExp ( ) const
```

Find out. returns the currently assigned regExp object. Note that it is returned as a const ref, meaning that if you use it in your custom parse operation, the main parse method has already searched for the pattern and filled in the results of this search, so that you can use QRegularExpressionMatch::captured() immediately, you don't have to search on your own.

For example when implementing the Option::parseOperation() method, get the regExp object with

```
const QRegularExpression& reg = regExp();
```

and immediately fetch possible matches with

```
const QString& param1 = reg.captured(1);
```

Option

Modifier

Returns

a const ref to the assigned regexp object

6.1090.1.6 registerButton()

```
QPushButton * Digikam::Rule::registerButton (
            QWidget * parent )
```

By calling this method, a new button for the parser object will be created and all necessary connections will be setup.

Parameters

parent	the parent object the button will be registered for

Returns

a pointer to the newly created button

6.1090.1.7 registerMenu()

```
QAction * Digikam::Rule::registerMenu (
            QMenu * parent )
```

By calling this method, a new action for the parser object will be created and all necessary connections will be setup.

Parameters

parent	the parent object the action will be registered for

Returns

a pointer to the newly created action

6.1090.1.8 reset()

```
void Digikam::Rule::reset ( )  [virtual]
```

6.1090.1.9 setUseTokenMenu()

```
void Digikam::Rule::setUseTokenMenu (
            bool value )  [protected]
```

If you want to display a menu for every defined token, set this method to 'true' and re-implement the

slotTokenTriggered method.

Parameters

value	boolean parameter to set token menu usage

6.1090.1.10 tokens()

```
TokenList & Digikam::Rule::tokens ( ) const
```

Returns

6.1097.1 Member Function Documentation

6.1097.1.1 abortInitialization()

```
void Digikam::ScanController::abortInitialization ( )
```

Any progress may be lost.

6.1097.1.2 beginFileMetadataWrite()

```
void Digikam::ScanController::beginFileMetadataWrite (
            const ItemInfo & info )
```

Calling these methods is equivalent.

6.1097.1.3 cancelAllAndSuspendCollectionScan()

```
void Digikam::ScanController::cancelAllAndSuspendCollectionScan ( )
```

This method returns when all scanning has stopped. This includes a call to suspendCollectionScan(). Restart with resumeCollectionScan.

6.1097.1.4 cancelCompleteScan()

```
void Digikam::ScanController::cancelCompleteScan ( )
```

It can be resumed later.

6.1097.1.5 completeCollectionScan()

```
void Digikam::ScanController::completeCollectionScan (
            bool defer = false )
```

Synchronous, returns when ready. The database will be locked while the scan is running. With the DeferFiles variant, deep files scanning (new files), the part which can take long, will be done during the time after the method returns, shortening the synchronous wait. After completeCollectionScanDeferFiles, you need to call allowToScan↩DeferredFiles() once to enable scanning the deferred files.

6.1097.1.6 databaseInitialization()

```
ScanController::Advice Digikam::ScanController::databaseInitialization ( )
```

Synchronous, returns when ready.

6.1097.1.7 finishFileMetadataWrite()

```
void Digikam::ScanController::finishFileMetadataWrite (
            const ItemInfo & info,
            bool changed )
```

Calling these methods is equivalent.

6.1097.1.8 hintAtModificationOfItems()

```
void Digikam::ScanController::hintAtModificationOfItems (
            const QList< qlonglong > & ids )
```

Note that a scan of the containing directory will need to be triggered nonetheless for the hints to take effect.

6.1097.1.9 hintAtMoveOrCopyOfAlbum()

```
void Digikam::ScanController::hintAtMoveOrCopyOfAlbum (
            const PAlbum *const album,
            const PAlbum *const dstAlbum,
            const QString & newAlbumName = QString() )
```

If the album is renamed, give the new name in newAlbumName. DstAlbum is the new parent album / dstPath is the new parent directory of the album, so do not include the album name to dstPath.

6.1097.1.10 hintAtMoveOrCopyOfItems()

```
void Digikam::ScanController::hintAtMoveOrCopyOfItems (
            const QList< qlonglong > & ids,
            const PAlbum *const dstAlbum,
            const QStringList & itemNames )
```

Give the list of existing items, specify the destination with dstAlbum, and give the names at destination in itemNames (Unless for rename, names wont usually change. Give them nevertheless.)

6.1097.1.11 restartCollectionScan()

```
void Digikam::ScanController::restartCollectionScan ( )
```

All scheduled scanning tasks are queued and will be done when restartCollectionScan() has been called.

6.1097.1.12 resumeCollectionScan()

```
void Digikam::ScanController::resumeCollectionScan ( )
```

All scheduled scanning tasks are queued and will be done when resumeCollectionScan() has been called. Calling these methods is recursive, you must resume as often as you called suspend.

6.1097.1.13 scheduleCollectionScan()

```
void Digikam::ScanController::scheduleCollectionScan (
            const QString & path )
```

Asynchronous, returns immediately.

6.1097.1.14 scheduleCollectionScanExternal()

```
void Digikam::ScanController::scheduleCollectionScanExternal (
            const QString & path )
```

Asynchronous, returns immediately. A very long delay with timer restart may be introduced before the actual scanning starts, so that you can call this often without checking for duplicates. This method is only for the QFileSystem↩ Watcher.

6.1097.1.15 scheduleCollectionScanRelaxed()

```
void Digikam::ScanController::scheduleCollectionScanRelaxed (
            const QString & path )
```

Asynchronous, returns immediately. A small delay may be introduced before the actual scanning starts, so that you can call this often without checking for duplicates. This method must only be used from the main thread.

6.1097.1.16 shutDown()

```
void Digikam::ScanController::shutDown ( )
```

Returns after all tasks are done.

6.1097.1.17 suspendCollectionScan()

```
void Digikam::ScanController::suspendCollectionScan ( )
```

All scheduled scanning tasks are queued and will be done when resumeCollectionScan() has been called. Calling these methods is recursive, you must resume as often as you called suspend.

6.1097.1.18 updateUniqueHash()

```
void Digikam::ScanController::updateUniqueHash ( )
```

Synchronous, returns when ready. The database will be locked while the scan is running.

6.1141.1 Member Function Documentation

6.1141.1.1 finish()

```
void Digikam::SearchXmlWriter::finish ( )
```

No further group can be added after calling this. You need to call this before you can get the resulting XML from xml().

6.1141.1.2 finishField()

```
void Digikam::SearchXmlWriter::finishField ( )
```

You shall call this method before adding another field, or closing the group.

6.1141.1.3 finishGroup()

```
void Digikam::SearchXmlWriter::finishGroup ( )
```

You cannot add anymore fields after calling this. Note that you will want to call this before writing another group if you want the group on the same level. You can as well add nested groups and call this to close the group afterwards.

6.1141.1.4 setDefaultFieldOperator()

```
void Digikam::SearchXmlWriter::setDefaultFieldOperator (
            SearchXml::Operator op )
```

The default operator can in each field be overridden. Default value is AND.

6.1141.1.5 setGroupOperator()

```
void Digikam::SearchXmlWriter::setGroupOperator (
            SearchXml::Operator op )
```

Default value is OR.

6.1141.1.6 writeField()

```
void Digikam::SearchXmlWriter::writeField (
            const QString & name,
            SearchXml::Relation relation )
```

Ensure that you closed the previous field with finishField(). For a reference of valid field names, look into ItemQueryBuilder. The general rule is that names are like the database fields, but all lower-case.

6.1141.1.7 writeGroup()

```
void Digikam::SearchXmlWriter::writeGroup ( )
```

Use the returned group writer to add fields.

6.1141.1.8 xml()

```
QString Digikam::SearchXmlWriter::xml ( ) const
```

The value is only valid if finish() has been called.

6.1148.1 Member Function Documentation

6.1148.1.1 createItemWidgets()

```
QList< QWidget * > Digikam::SetupCollectionDelegate::createItemWidgets (
            const QModelIndex & index ) const  [override], [virtual]
```

Note

No initialization of the widgets is supposed to happen here. The widgets will be initialized based on needs for a given item.

If you want to connect some widget signals to any slot, you should do it here.

- index the index to create widgets for.

Note

If you want to know the index for which you are creating widgets, it is available as a QModelIndex Q_↩ PROPERTY called "goya:creatingWidgetsForIndex". Ensure to add Q_DECLARE_METATYPE(QModelIndex) before your method definition to tell QVariant about QModelIndex.

Returns

the list of newly created widgets which will be used to interact with an item.

updateItemWidgets()

Implements Digikam::DWItemDelegate.

6.1148.1.2 updateItemWidgets()

            const QStyleOptionViewItem & option,
            const QPersistentModelIndex & index ) const  [override], [virtual]
```

Note

All the positioning and sizing should be done in item coordinates.

Warning

Do not make widget connections in here, since this method will be called very regularly.

Parameters

widgets	the widgets to update
option	the current set of style options for the view.
index	the model index of the item currently manipulated.

Implements Digikam::DWItemDelegate.

IsAppendRole	Returns true if the model index is the index of a button.
AppendDecorationRole	The pixmap of the button.
IsUpdateRole	Returns true if the model index is the index of a button.
UpdateDecorationRole	The pixmap of the button.
IsDeleteRole	Returns true if the model index is the index of a button.
DeleteDecorationRole	The pixmap of the button.

6.1149.2 Constructor & Destructor Documentation

6.1149.2.1 SetupCollectionModel()

```
Digikam::SetupCollectionModel::SetupCollectionModel (
            QObject *const parent = nullptr )  [explicit]
```

The category entries get a model index with INTERNALID and are identified by their row(). The item entries get the index in m_collections as INTERNALID. No item is ever removed from m_collections, deleted entries are only marked as such.

Items have a location, a parentId, and a name and label field. parentId always contains the category, needed to implement parent(). The location is the location if it exists, or is null if the item was added. Name and label are null if unchanged, then the values from location are used. They are valid if edited (label) or the location was added (both valid, location null).

6.1149.3 Member Function Documentation

6.1149.3.1 slotAppendPressed

```
void Digikam::SetupCollectionModel::slotAppendPressed (
            int mappedId )  [slot]
```

mappedId is retrieved with the ButtonMapId role for the model index of the button

6.1149.3.2 slotCategoryButtonPressed

```
void Digikam::SetupCollectionModel::slotCategoryButtonPressed (
            int mappedId )  [slot]
```

mappedId is retrieved with the CategoryButtonMapId role for the model index of the button

6.1176.1 Detailed Description

Since this class derives from StateSavingObject, you can call StateSavingObject::loadState() and StateSavingObject::saveState() for loading/saving of settings. However, if you use multiple sidebar instances in your program, you have to remember to either call QObject::setObjectName(), StateSavingObject::setEntryPrefix() or StateSavingObject::setConfigGroup() first.

6.1176.2 Constructor & Destructor Documentation

6.1176.2.1 Sidebar()

```
Digikam::Sidebar::Sidebar (
            QWidget *const parent,
            SidebarSplitter *const sp,
            Qt::Edge side = Qt::LeftEdge,
            bool minimizedDefault = false )  [explicit]
```

Parameters

parent	sidebar's parent
sp	sets the splitter, which should handle the width. The splitter normally is part of the main view. Internally, the width of the widget stack can be changed by a QSplitter.
side	where the sidebar should be displayed. At the left or right border. Use Qt::LeftEdge or Qt::RightEdge.
minimizedDefault	hide the sidebar when the program is started the first time.

6.1176.3 Member Function Documentation

            const QList< QWidget * > & thirdWidgetsToBackup,
            QList< int > *const sizes )
```

If there are other widgets in this splitter, stores their sizes in the provided list.

```

Implements Digikam::StateSavingObject.

  Always use this method to create config group entry names.
- KConfigGroup getConfigGroup () const

  Returns the config group that must be used for state saving and loading.

6.1195.1 Detailed Description

Use this class as a Mixin.

The public interface for loading and saving state is implemented designed as template methods. To store or restore the state of a class, inherit from this class via multiple inheritance and implement doLoadState() and doSaveState(). In these methods always use the protected method getConfigGroup() to access a config group. Also always use the entryName() method for generating keys in the config (for prefixes, see below).

Ensure that this class is inherited after a QObject-based class and pass "this" as constructor argument.

By default a config group based on Qt's object name of the class is used. This behaviour can be changed by setting a dedicated config group via setConfigGroup(). This is useful for to externally control the config group and shouldn't be used inside the implementing class.

Additionally to setting the config group, also a prefix for each config group entry can be defined via setEntryPrefix(). This may be useful if multiple instances of the same class shall be stored in the same config group or can generally be a good idea to make the config more readable and recognizable. By default this prefix is empty.

This class also supports recursive saving / loading invocations based on the QT object hierarchy. As default, calls to loadState() or saveState() only invoke the doLoadState() or doStateSave() method of the called instance. This behaviour can be changed with setStateSavingDepth() to automatically call children of the instance. Various modes are supported as documented in StateSavingDepth.

6.1198.1 Constructor & Destructor Documentation

6.1198.1.1 StayPoppedUpComboBox()

```
Digikam::StayPoppedUpComboBox::StayPoppedUpComboBox (
            QWidget *const parent = nullptr )  [explicit]
```

The Pop-up of the combo box will stay open after selecting an item; it will be closed by clicking outside, but not inside the widget. You need three steps: Construct the object, call setModel() with an appropriate QAbstractItemModel, then call installView() to replace the standard combo box view with a view.

6.1198.2 Member Function Documentation

6.1198.2.1 installView()

```
void Digikam::StayPoppedUpComboBox::installView (
            QAbstractItemView * view )  [protected]
```

The view will be set as the view of the combo box (including re-parenting) and be stored in the m_view variable.

6.1198.2.2 sendViewportEventToView()

```
virtual void Digikam::StayPoppedUpComboBox::sendViewportEventToView (
            QEvent * e )  [protected], [pure virtual]
```

This method is protected for a usual QAbstractItemView. You can override, pass a view, and call parent implementation. The existing view will be used. You must then also reimplement sendViewportEventToView.

Implemented in Digikam::AbstractAlbumTreeViewSelectComboBox, Digikam::TreeViewComboBox, and Digikam::ListViewComboBox.

6.1232.1 Member Function Documentation

6.1232.1.1 addCustomContextMenuActions()

```
void Digikam::TagCheckView::addCustomContextMenuActions (
            ContextMenuHelper & cmh,
            Album * album )  [override], [protected], [virtual]
```

Parameters

cmh	helper object to create the context menu
album	tag on which the context menu will be created. May be null if it is requested on no tag entry

Reimplemented from Digikam::AbstractAlbumTreeView.

Reimplemented in Digikam::TagFilterView.

6.1232.1.2 checkedTagsChanged

```
void Digikam::TagCheckView::checkedTagsChanged (
            const QList< TAlbum * > & includedTags,
            const QList< TAlbum * > & excludedTags )  [signal]
```

Parameters

includedTags	a list of selected tag ids processed.
excludedTags	a list of tag ids ignored.

6.1232.1.3 doLoadState()

```
void Digikam::TagCheckView::doLoadState ( )  [override], [virtual]
```

Therefore the config is first parsed into d->statesByAlbumId which holds the state of all tree view entries indexed by album id. Afterwards an initial sync run is done restoring the state of all model entries that are already present at this time. Every processed entry is removed from d->statesByAlbumId. If there are still entries left in this map we assume that the model is not fully loaded at the moment. Therefore the rowsInserted signal is connected to a slot that restores the state of new rows based on the remaining entries in d->statesByAlbumId.

Reimplemented from Digikam::AbstractCheckableAlbumTreeView.

6.1232.1.4 doSaveState()

```
void Digikam::TagCheckView::doSaveState ( )  [override], [virtual]
```

Use getConfigGroup() and entryName() for the implementation.

Reimplemented from Digikam::AbstractCheckableAlbumTreeView.

6.1232.1.5 setCheckNewTags()

```
void Digikam::TagCheckView::setCheckNewTags (
            bool checkNewTags )
```

Parameters

checkNewTags	is switched on, a tag that is created from *within* this view, typically via the context menu, will automatically be set checked.

            Album * album )  [override], [protected], [virtual]
```

The default implementation adds actions to reset the tag icon and to find duplicates in a tag album. If you want to use these actions, remember to call this class' implementation of this method and the handleCustomContextMenuAction in your derived class.

Parameters

cmh	helper object to create the context menu
album	tag on which the context menu will be created. May be null if it is requested on no tag entry

6.1248.2 Constructor & Destructor Documentation

6.1248.2.1 TagModificationHelper()

```

            QObject *const parent,
            QWidget *const dialogParent )  [explicit]
```

Parameters

parent	the parent for qt parent child mechanism
dialogParent	parent widget for dialogs displayed by this object

6.1248.3 Member Function Documentation

6.1248.3.1 bindMultipleTags()

```
void Digikam::TagModificationHelper::bindMultipleTags (
            QAction * action,
            const QList< TAlbum * > & tags )
```

Make sure that QVector is not a local object and it's not destroyed before boundMultipleTags are called

Parameters

action	- action to store pointer
tags	- QVector pointer to be stored

6.1248.3.2 bindTag()

```
void Digikam::TagModificationHelper::bindTag (
            QAction * action,
            TAlbum * parent ) const
```

You must call bindTag and then connect the action's triggered to the desired slot, slotTagNew(), slotTagEdit() or slotTagDelete(). Note: Changes the Action's user data.

6.1248.3.3 boundMultipleTags()

```
QList< TAlbum * > Digikam::TagModificationHelper::boundMultipleTags (
            QObject * sender )
```

Use when context menu should delete more than one item: multiple-selection.

6.1248.3.4 boundTag()

```
TAlbum * Digikam::TagModificationHelper::boundTag (
            QObject * action ) const
```

The given QObject shall be a QAction, but for convenience the given object will be checked with qobject_cast first, so you can pass QObject::sender().

6.1248.3.5 slotFaceTagDelete

```
void Digikam::TagModificationHelper::slotFaceTagDelete (
            TAlbum * tag )  [slot]
```

The tag itself is not deleted. Only its property as face tag.

Parameters

tag	the face tag to delete

6.1248.3.6 slotMultipleFaceTagDel

```
void Digikam::TagModificationHelper::slotMultipleFaceTagDel (
            const QList< TAlbum * > & tags )  [slot]
```

Only their properties as face tags.

Parameters

tags	face tags to be deleted.

6.1248.3.7 slotMultipleTagDel

```
void Digikam::TagModificationHelper::slotMultipleTagDel (
            const QList< TAlbum * > & tags )  [slot]
```

Delete multiple tags and prompt user only once for all

Parameters

tags	the tags to be deleted, without root tag

Tags must be deleted from children to parents, if we don't want to step on invalid index. Use QMultiMap to order them by distance to root tag

QMultimap doesn't provide reverse iterator, use QList.

6.1248.3.8 slotMultipleTagsToFaceTags

```
void Digikam::TagModificationHelper::slotMultipleTagsToFaceTags (
            const QList< TAlbum * > & tags )  [slot]
```

Parameters

tags	the tags to mark.

6.1248.3.9 slotTagDelete

```
void Digikam::TagModificationHelper::slotTagDelete (
            TAlbum * tag )  [slot]
```

Parameters

tag	the tag to delete, must not be the root tag album

6.1248.3.10 slotTagEdit

```
void Digikam::TagModificationHelper::slotTagEdit (
            TAlbum * tag )  [slot]
```

Parameters

tag	the tag to change

6.1248.3.11 slotTagNew [1/2]

```
TAlbum * Digikam::TagModificationHelper::slotTagNew ( )  [slot]
```

Without this mechanism, will add a toplevel tag.

Returns

new tag created or 0 if no tag was created

6.1248.3.12 slotTagNew [2/2]

```
TAlbum * Digikam::TagModificationHelper::slotTagNew (
            TAlbum * parent,
            const QString & title = QString(),
            const QString & iconName = QString() )  [slot]
```

If only the parent is given, then a dialog is shown to create new tags. Else, if also a title and optionally an icon are given, then these values will be used directly to create the tag.

Parameters

parent	the parent tag album under which to create the new tags. May be 0 to use the root album
title	if this isn't an empty string, then this tag name is suggested
iconName	an optional name for the icon to suggest for the new tag

Returns

new tag album or 0 if not created

6.1248.3.13 slotTagToFaceTag

```
void Digikam::TagModificationHelper::slotTagToFaceTag (

It is meant to be a short-lived object, it does not listen to external database changes.

6.1249.2 Member Function Documentation

6.1249.2.1 addProperty()

```
void Digikam::TagProperties::addProperty (

6.1250.1 Member Function Documentation

6.1250.1.1 isFiltering()

```
bool Digikam::TagPropertiesFilterModel::isFiltering ( ) const  [override], [virtual]
```

Returns

`true` if the current selected filter could result in any filtering without checking if this really happens.

Reimplemented from Digikam::CheckableAlbumFilterModel.

```
bool Digikam::TagPropertiesFilterModel::matches (
            Album * album ) const  [override], [protected], [virtual]
```

Return true if this single album matches the current criteria. This method can be overridden to provide custom filtering.

Parameters

album	the album to tell if it matches the filter criteria or not.

Reimplemented from Digikam::CheckableAlbumFilterModel.

6.1254.1 Member Function Documentation

6.1254.1.1 absoluteToRelative()

```
QRectF Digikam::TagRegion::absoluteToRelative (
            const QRect & region,
            const QSize & fullSize )  [static]
```

Used to write back rectangles into image's XMP. see MetadataHub::write.

6.1254.1.2 adjustToOrientation()

```
QSize Digikam::TagRegion::adjustToOrientation (
            QRect & region,
            int orientation,
            const QSize & fullSize )  [static]
```

The value region are calculated for the new image orientation.

6.1254.1.3 intersects()

```
bool Digikam::TagRegion::intersects (
            const TagRegion & other,
            double fraction = 0 )
```

fraction describes the relative overlap area needed to return true: If fraction is 0, returns true if the regions intersect at all. If fraction is 1, returns true only if other is completely contained in this region. If fraction is x, $0 < x < 1$, returns true if the area of this region covered by the other is greater than x. Invalid areas never intersect.

6.1254.1.4 reverseToOrientation()

```
void Digikam::TagRegion::reverseToOrientation (
            QRect & region,
            int orientation,
            const QSize & fullSize )  [static]
```

The value region are calculated for the new image orientation.

6.1254.1.5 toVariant()

```
QVariant Digikam::TagRegion::toVariant ( ) const
```

Will only use native QVariant types.

6.1255.1 Member Function Documentation

6.1255.1.1 registerLabelsActions()

```
void Digikam::TagsActionMngr::registerLabelsActions (
            KActionCollection *const ac )
```

Unlike tags actions, labels shortcuts are stored in XML GUI file of each root windows, to be able to customize it through KDE keyboards shortcuts config panel. This method must be called before to DXmlGuiWindow::create↩ GUI(), typically when window actions are registered to ActionCollection instance.

6.1255.1.2 registerTagsActionCollections()

```
void Digikam::TagsActionMngr::registerTagsActionCollections ( )
```

Because Tags shortcuts are stored in database this method must be called after database initialization and after that all root window instances have been created.

6.1255.1.3 updateTagShortcut()

```
void Digikam::TagsActionMngr::updateTagShortcut (
            int tagId,
            const QKeySequence & ks,
            bool delAction = true )
```

Call this when a shortcut was added, removed or changed.

6.1256.1 Member Enumeration Documentation

6.1256.1.1 LeadingSlashPolicy

```
enum Digikam::TagsCache::LeadingSlashPolicy
```

Enumerator

NoLeadingSlash	Ex: "Places/Cities/Paris".
IncludeLeadingSlash	Ex: "/Places/Cities/Paris".

6.1256.2 Member Function Documentation

6.1256.2.1 canBeWrittenToMetadata()

```
bool Digikam::TagsCache::canBeWrittenToMetadata (
            int tagId ) const
```

Always returns false if the tag is a program-internal tag.

6.1256.2.2 colorLabelForTag()

```
int Digikam::TagsCache::colorLabelForTag (
            int tagId )
```

see ColorLabel values from globals.h. Return -1 if not it's found.

6.1256.2.3 colorLabelFromTags()

```
int Digikam::TagsCache::colorLabelFromTags (
            const QList< int > & tagIds )
```

Returns -1 if no tag in the list is a color label tag.

6.1256.2.4 createTag()

```
int Digikam::TagsCache::createTag (
            const QString & tagPathToCreate )
```

Returns the tag id. Use this if you know that tag path does not exist. If you are unsure, use getOrCreateTag.

6.1256.2.5 getOrCreateTag()

```
int Digikam::TagsCache::getOrCreateTag (
            const QString & tagPath )
```

If a tag does not exist yet and create is true, it will be created. Otherwise the id 0 is returned for this path.

6.1256.2.6 getOrCreateTagWithProperty()

```
int Digikam::TagsCache::getOrCreateTagWithProperty (
            const QString & tagPath,
            const QString & property,
            const QString & value = QString() )
```

If you pass a null string as value, then the value is not checked and not changed.

6.1256.2.7 hasProperty()

```
bool Digikam::TagsCache::hasProperty (
            int tagId,
            const QString & property,
            const QString & value = QString() ) const
```

b) has the property with the given value (value not null).

6.1256.2.8 parentTags()

```
QList< int > Digikam::TagsCache::parentTags (
            int id ) const
```

If the tag is a toplevel tag or does not exist, an empty list is returned.

6.1256.2.9 pickLabelForTag()

```
int Digikam::TagsCache::pickLabelForTag (
            int tagId )
```

see PickLabel values from globals.h. Return -1 if not it's found.

6.1256.2.10 pickLabelFromTags()

```
int Digikam::TagsCache::pickLabelFromTags (
            const QList< int > & tagIds )
```

Returns -1 if no tag in the list is a pick label tag.

6.1256.2.11 properties()

```
QMap< QString, QString > Digikam::TagsCache::properties (
            int tagId ) const
```

Note: The list and map may be constructed for each call. Prefer hasProperty() and property().

6.1256.2.12 propertyValue()

```
QString Digikam::TagsCache::propertyValue (
            int tagId,
            const QString & property ) const
```

Returning a null string cannot distinguish between the property set with a null value, or the property not set. The first method returns any property, if multiple are set with the same key.

6.1256.2.13 shortenedTagPaths()

```
QStringList Digikam::TagsCache::shortenedTagPaths (
            const QList< int > & ids,
            LeadingSlashPolicy slashPolicy = IncludeLeadingSlash,
            HiddenTagsPolicy hiddenTagsPolicy = IncludeHiddenTags ) const
```

Orders the given tag paths. If tags begin with the same path (parent tags), the relevant part is cut off in the second line. The second variant allows you to pass a list as return parameter. This list will contain, upon return, the tag id corresponding to each tag in the returned, sorted list of shortened paths.

6.1256.2.14 tagAdded

```
void Digikam::TagsCache::tagAdded (
            int tagId )  [signal]
```

Use a queued connection if you carry out longer operations from slots connected to these signals.

6.1256.2.15 tagForColorLabel()

```
int Digikam::TagsCache::tagForColorLabel (
            int label )
```

see ColorLabel values from globals.h. Return 0 if not it's found.

6.1256.2.16 tagForName()

```
int Digikam::TagsCache::tagForName (
            const QString & tagName,
            int parentId = 0 ) const
```

If parentId is 0, the tag is a toplevel tag. Returns 0 if there is no such tag.

6.1256.2.17 tagForPath()

```
int Digikam::TagsCache::tagForPath (
            const QString & path ) const
```

The path can be given with or without leading slash. Returns 0 if there is no such tag, or if path is empty. If you want to create the tag if it does not yet exist, use getOrCreateTag.

6.1256.2.18 tagForPickLabel()

```
int Digikam::TagsCache::tagForPickLabel (
            int label )
```

see PickLabel values from globals.h. Return 0 if not it's found.

6.1256.2.19 tagName()

```
QString Digikam::TagsCache::tagName (
            int id ) const
```

For the tag Places/Cities/Paris, this is Paris. If there is no tag for the given id a null string is returned.

6.1256.2.20 tagPath()

```
QString Digikam::TagsCache::tagPath (
            int id,
            LeadingSlashPolicy slashPolicy = IncludeLeadingSlash ) const
```

For the tag Places/Cities/Paris, this is Places/Cities/Paris. If there is no tag for the given id a null string is returned.

6.1256.2.21 tagsForName()

```
QList< int > Digikam::TagsCache::tagsForName (
            const QString & tagName,
            HiddenTagsPolicy hiddenTagsPolicy = NoHiddenTags ) const
```

For "Paris", this may give "Places/Cities/Paris" and "Places/USA/Texas/Paris". If there is no tag with the given name at all, returns an empty list.

6.1256.2.22 tagsWithProperty()

```
QList< int > Digikam::TagsCache::tagsWithProperty (
            const QString & property,
            const QString & value = QString() ) const
```

The tag: a) just has the property. b) has the property with the given value (value not null). Note: The returned list is sorted.

6.1256.2.23 tagsWithPropertyCached()

```
QList< int > Digikam::TagsCache::tagsWithPropertyCached (
            const QString & property ) const
```

Use it for queries for which you know that they will be issued very often, so that it's worth caching the result of the already pretty fast tagsWithProperty().

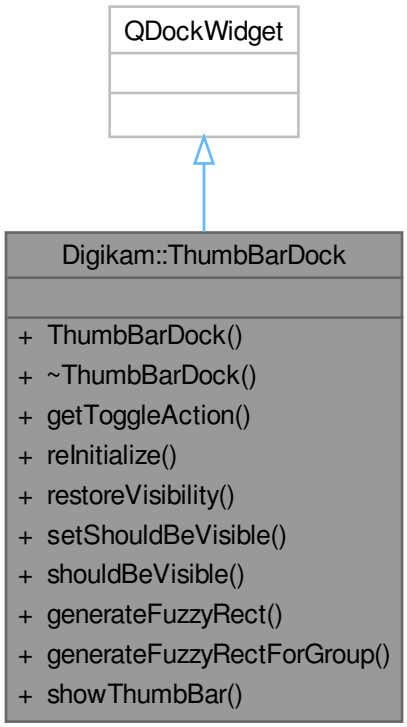
6.1283 Digikam::ThumbBarDock Class Reference

A dock widget specifically designed for thumbnail bars (class ThumbNailView or one of its descendants).

Inheritance diagram for Digikam::ThumbBarDock:



Public Types

- enum **Visibility** { **WAS_HIDDEN** , **WAS_SHOWN** , **SHOULD_BE_HIDDEN** , **SHOULD_BE_SHOWN** }

Public Slots

- void **showThumbBar** (bool)

Public Member Functions

- **ThumbBarDock** (QWidget ∗const parent=nullptr, Qt::WindowFlags flags=Qt::WindowFlags())
- QAction ∗ **getToggleAction** (QObject ∗const parent, const QString &caption=QString()) const

  Return an Action to show and hide the thumbnail bar.
- void reInitialize ()

  Measure the orientation and size of the widget and adjust the containing thumbnail bar accordingly.
- void **restoreVisibility** ()
- void **setShouldBeVisible** (bool)
- bool shouldBeVisible () const

  The normal show() and hide() functions don't apply that well, because there are two orthogonal reasons to hide the thumbbar: the user doesn't want it, and the window with the thumbbar isn't shown.

Static Public Member Functions

- static QPixmap **generateFuzzyRect** (const QSize &size, const QColor &color, int radius, const QColor &fill↩ Color=Qt::transparent)
- static QPixmap **generateFuzzyRectForGroup** (const QSize &size, const QColor &color, int radius)

6.1283.1 Detailed Description

It provides the same look as a toolbar.

6.1283.2 Member Function Documentation

6.1283.2.1 reInitialize()

```
void Digikam::ThumbBarDock::reInitialize ( )
```

Normally not needed, but useful when the dock widget has changed location and/or size and the appropriate signals aren't emitted.

6.1283.2.2 shouldBeVisible()

```
bool Digikam::ThumbBarDock::shouldBeVisible ( ) const
```

The restoreVisibility() function will set the visibility status to what it should be according to the user setting. The set↩ ShouldBeVisible() function can change this setting. showThumbBar() can be used to hide and show the thumbbar according to the user preference. shouldBeVisible() tells whether the thumbbar should be shown according to the user.

6.1285.1 Constructor & Destructor Documentation

6.1285.1.1 ThumbnailCreator()

```
Digikam::ThumbnailCreator::ThumbnailCreator (
            StorageMethod method )  [explicit]
```

You must call setThumbnailSize before load.

6.1285.2 Member Function Documentation

6.1285.2.1 deleteThumbnailsFromDisk()

```
void Digikam::ThumbnailCreator::deleteThumbnailsFromDisk (
            const QString & filePath ) const
```

A subsequent call to load() will recreate the thumbnail.

6.1285.2.2 errorString()

```
QString Digikam::ThumbnailCreator::errorString ( ) const
```

It is valid if load returned a null QImage object.

6.1285.2.3 loadDetail()

```
QImage Digikam::ThumbnailCreator::loadDetail (
            const ThumbnailIdentifier & identifier,
            const QRect & detailRect,
            bool onlyStorage = false ) const
```

A suitable custom identifier (for cache key etc.) is inserted as image.text("customIdentifier").

6.1285.2.4 setExifRotate()

```
void Digikam::ThumbnailCreator::setExifRotate (
            bool rotate )
```

If exifRotate is true, the thumbnail will be rotated according to the Exif information. Default value is true.

6.1285.2.5 setLoadingProperties()

```
void Digikam::ThumbnailCreator::setLoadingProperties (
            DImgLoaderObserver *const observer,
            const DRawDecoding & settings )
```

They will be passed if a thumbnail is created by loading with DImg. Note that DImg is not used in most cases (Raw files, JPEG)

6.1285.2.6 setOnlyLargeThumbnails()

```
void Digikam::ThumbnailCreator::setOnlyLargeThumbnails (
            bool onlyLarge )
```

Normally, for requested sizes below 128, thumbnails of 128x128 will be cached on disk. Default value is false.

6.1285.2.7 setRemoveAlphaChannel()

```
void Digikam::ThumbnailCreator::setRemoveAlphaChannel (
            bool removeAlpha )
```

Images with transparency will be blended over an opaque background.

6.1285.2.8 setThumbnailSize()

```
void Digikam::ThumbnailCreator::setThumbnailSize (
            int thumbnailSize )
```

This is the maximum size of the QImage returned by load.

6.1285.2.9 store()

```
void Digikam::ThumbnailCreator::store (
            const QString & path,
            const QImage & image ) const
```

Image should at least have storedSize().

6.1285.2.10 storedSize()

```
int Digikam::ThumbnailCreator::storedSize ( ) const
```

This size is possibly larger than thumbnailSize. Possible values: 128 or 256.

Protected Slots

6.1287.1 Constructor & Destructor Documentation

6.1287.1.1 ThumbnailImageCatcher()

```
Digikam::ThumbnailImageCatcher::ThumbnailImageCatcher (
            QObject *const parent = nullptr )  [explicit]
```

1. Create the ThumbnailImageCatcher object with your ThumbnailLoadThread
2. a) Request a thumbnail b) Call enqueue()
3. Call waitForThumbnails which returns the thumbnail QImage(s).

Note: Not meant for loading QPixmap thumbnails.

6.1287.2 Member Function Documentation

6.1287.2.1 cancel

```
void Digikam::ThumbnailImageCatcher::cancel ( )  [slot]
```

The results will be returned as received so far.

6.1287.2.2 enqueue()

```
int Digikam::ThumbnailImageCatcher::enqueue ( )
```

Enqueue records the requested loading operation in an internal list. A loading operation can result in the return of more than one thumbnail, so enqueue() returns the number of expected results. Then call waitForThumbnails. The returned list is the sum of previous calls to enqueue, one entry per expected result, in order. If stopped prematurely or loading failed, the respective entries will be null.

6.1287.2.3 setActive

```
void Digikam::ThumbnailImageCatcher::setActive (
            bool active )  [slot]
```

Deactivate it if you use the catcher as a longer-lived object and do not use it for some time, then activate it before you request a thumbnail from the thread again.

6.1291.1 Member Function Documentation

6.1291.1.1 defaultThread()

```
ThumbnailLoadThread * Digikam::ThumbnailLoadThread::defaultThread ( )  [static]
```

It is perfectly all right to create an extra object of the class, but it is useful to have default object

6.1291.1.2 deleteThumbnail()

```
void Digikam::ThumbnailLoadThread::deleteThumbnail (
            const QString & filePath )  [static]
```

All thumbnail files for the given file will be removed from disk, and the cached instances will be removed as well. Use this method if you know that the contents of the file has changed. This method works independently from the multithreaded thumbnail loading.

6.1291.1.3 find() [1/2]

```
void Digikam::ThumbnailLoadThread::find (
            const ThumbnailIdentifier & identifier )
```

This method sends the signals and does not return values like the method above. If you certainly need asynchronous return, connect with Qt::QueuedConnection to the signals. If you connect directly, the signals may be sent from within the method call.

6.1291.1.4 find() [2/2]

```
bool Digikam::ThumbnailLoadThread::find (
            const ThumbnailIdentifier & identifier,
            QPixmap & pixmap )
```

If the pixmap is found in the cache, returns true and sets pixmap to the found QPixmap. If the pixmap is not found in the cache, load() is called to start the loading process, false is returned and pixmap is not touched.

6.1291.1.5 findGroup()

```
void Digikam::ThumbnailLoadThread::findGroup (
            QList< ThumbnailIdentifier > & identifiers )
```

The items will be loaded in order and signals will be sent. Can be used to ensure that thumbnails are loaded in a particular order

6.1291.1.6 initializeNoThumbnailStorage()

```
void Digikam::ThumbnailLoadThread::initializeNoThumbnailStorage ( )  [static]
```

This shall be called once at application startup. This need not be called, then the FreeDesktop standard is used.

6.1291.1.7 initializeThumbnailDatabase()

```
void Digikam::ThumbnailLoadThread::initializeThumbnailDatabase (
            const DbEngineParameters & params,
            ThumbnailInfoProvider *const provider = nullptr )  [static]
```

This shall be called once at application startup. This need not be called, then the FreeDesktop standard is used. You can optionally provide a thumbnail info provider.

6.1291.1.8 lastDescriptions()

```
QList< LoadingDescription > Digikam::ThumbnailLoadThread::lastDescriptions ( ) const
```

After calling single-thumbnail methods (find, preload) the list will have size 1, after the group methods (findGroup, preloadGroup, pregenerateGroup) the list can be larger than 1. There is no information if the description was ever scheduled in the thread, already processed, skipped or canceled.

6.1291.1.9 load()

```
void Digikam::ThumbnailLoadThread::load (
            const LoadingDescription & description )  [override], [virtual]
```

You do not need to use this method directly, it will not access the pixmap cache. Use find(). The LoadingDescription shall be constructed with the constructor for preview/thumbnail jobs. (in the description constructor, you need to specify file path, thumbnail size and Exif rotation)

Reimplemented from Digikam::ManagedLoadSaveThread.

6.1291.1.10 maximumThumbnailSize()

```
int Digikam::ThumbnailLoadThread::maximumThumbnailSize ( )  [static]
```

If you request a larger size, the thumbnail will not load. The size of the pixmap can slightly differ, especially when highlighting.

6.1291.1.11 pregenerateGroup()

```
void Digikam::ThumbnailLoadThread::pregenerateGroup (
            const QList< ThumbnailIdentifier > & identifiers )
```

No signals will be emitted when these are loaded.

6.1291.1.12 preload()

```
void Digikam::ThumbnailLoadThread::preload (
            const ThumbnailIdentifier & identifier )
```

This is essentially the same as loading, but with a lower priority.

6.1291.1.13 setDisplayingWidget()

```
void Digikam::ThumbnailLoadThread::setDisplayingWidget (
            QWidget *const widget )  [static]
```

(currently it is only possible to set one global widget)

6.1291.1.14 setHighlightPixmap()

```
void Digikam::ThumbnailLoadThread::setHighlightPixmap (
            bool highlight )
```

This option has only an effect if pixmapRequested is true. Default value: Enabled.

6.1291.1.15 setPixmapRequested()

```
void Digikam::ThumbnailLoadThread::setPixmapRequested (
            bool wantPixmap )
```

If you do not enable this, only the QImage-based signal (see LoadSaveThread) will be emitted.

If you disable this, pay attention to the (global) setting of the LoadingCache, which per default does not cache the images !!

Default value: Enabled.

6.1291.1.16 setSendSurrogatePixmap()

```
void Digikam::ThumbnailLoadThread::setSendSurrogatePixmap (
            bool send )
```

It will use standard system icons to replace the real thumbnail. If you disable this, a null QPixmap will be sent. This does not influence the QImage-based signal; this signal will be emitted with a null QImage regardless of this setting here, if the loading failed. Default value: Enabled.

6.1291.1.17 setThumbnailSize()

```
void Digikam::ThumbnailLoadThread::setThumbnailSize (
            int size,
            bool forFace = false )
```

Note

If the thread is currently loading thumbnails, there is no guarantee as to when the property change by one of the following methods takes effect. Default value: 128

6.1291.1.18 signalThumbnailLoaded

```
void Digikam::ThumbnailLoadThread::signalThumbnailLoaded (
            const LoadingDescription & loadingDescription,
            const QPixmap & pix )  [signal]
```

Note

See LoadSaveThread for a QImage-based thumbnailLoaded() signal.

6.1291.1.19 storeDetailThumbnail()

```
void Digikam::ThumbnailLoadThread::storeDetailThumbnail (
            const QString & filePath,
            const QRect & detailRect,
            const QImage & image,
            bool isFace = false )
```

Use this if possible because generation of detail thumbnails is potentially slower. The image should at least have storedSize().

6.1291.1.20 thumbnailCreator()

```
ThumbnailCreator * Digikam::ThumbnailLoadThread::thumbnailCreator ( ) const
```

Note

For internal use - may only be used from the thread

6.1291.1.21 thumbnailLoaded()

```
void Digikam::ThumbnailLoadThread::thumbnailLoaded (
            const LoadingDescription & loadingDescription,
            const QImage & img )  [override], [protected], [virtual]
```

Reimplemented from Digikam::LoadSaveThread.

6.1291.1.22 thumbnailsAvailable

```
void Digikam::ThumbnailLoadThread::thumbnailsAvailable ( )  [signal]
```

Note

For internal use only.

6.1291.1.23 thumbnailToPixmapSize()

```
int Digikam::ThumbnailLoadThread::thumbnailToPixmapSize (
            int size ) const
```

These can differ when highlighting is turned on.

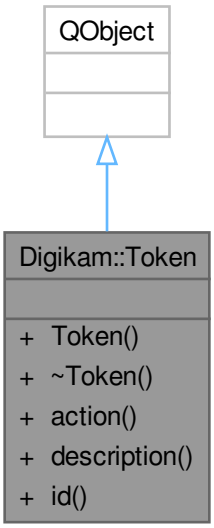
6.1308 Digikam::Token Class Reference

Token is the smallest parsing unit in AdvancedRename utility

Inheritance diagram for Digikam::Token:



Signals

- void **signalTokenTriggered** (const QString &)

  This signal is emitted when the action of the token is triggered.

Public Member Functions

- **Token** (const QString &id, const QString &description)
- QAction * action () const
- QString description () const
- QString id () const

6.1308.1 Detailed Description

The Token class represents the smallest parsing unit for the Parser class. Every string you enter as a renaming pattern is a combination of tokens and literal text. For example
```
"[file]{upper}_###_abc.[ext]{lower}"
```

is composed of five tokens
```
[file]
{upper}
###
.[ext]
{lower}
```

and two literals
```
_
_abc
```

A rule must assign at least one token object, to make parsing work. More than one token can be assigned to a Rule.

See also

Rule::addToken()

6.1308.2 Member Function Documentation

6.1308.2.1 action()

```
QAction * Digikam::Token::action ( ) const
```

Returns

The action of the token. This action can be connected to a button or menu item. If triggered, high-level classes like AdvancedRenameWidget can connect to the signal and display the emitted text in the line edit input widget.

6.1308.2.2 description()

```
QString Digikam::Token::description ( ) const
```

Returns

The description of the token. It can be used for example in the tooltip of the AdvancedRenameWidget.

6.1308.2.3 id()

```
QString Digikam::Token::id ( ) const
```

Returns

The ID of the token. This is the actual token string, for example
`"[file]"`

This id will be emitted as a signal by slotTriggered().

6.1336.1.1 TreeViewComboBox()

```
Digikam::TreeViewComboBox::TreeViewComboBox (
            QWidget * parent = nullptr )  [explicit]
```

You need three steps: Construct the object, call setModel() with an appropriate QAbstractItemModel, then call installView() to replace the standard combo box view with a QTreeView.

6.1336.2 Member Function Documentation

6.1336.2.1 installView()

```
void Digikam::TreeViewComboBox::installView (
            QAbstractItemView * view = nullptr )  [virtual]
```

Call this after installing an appropriate model.

Reimplemented in Digikam::AlbumSelectComboBox, Digikam::AbstractAlbumTreeViewSelectComboBox, and Digikam::TreeViewLineEditComboBox.

6.1336.2.2 sendViewportEventToView()

```
void Digikam::TreeViewComboBox::sendViewportEventToView (
            QEvent * e )  [override], [protected], [virtual]
```

This method is protected for a usual QAbstractItemView. You can override, pass a view, and call parent implementation. The existing view will be used. You must then also reimplement sendViewportEventToView.

Implements Digikam::StayPoppedUpComboBox.

6.1336.2.3 view()

```
QTreeView * Digikam::TreeViewComboBox::view ( ) const  [virtual]
```

Valid after installView() has been called

6.1337.2.2 installView()

```
void Digikam::TreeViewLineEditComboBox::installView (
            QAbstractItemView * view = nullptr )  [override], [virtual]

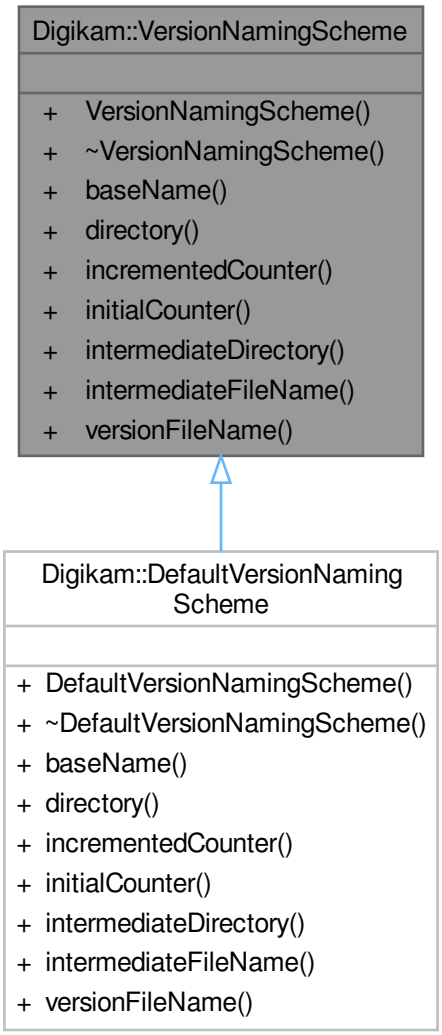
6.1356 Digikam::VersionNamingScheme Class Reference

Inheritance diagram for Digikam::VersionNamingScheme:



Public Member Functions

- **VersionNamingScheme** ()=default

  Creates and analyzes file names of versioned files.
- virtual QString baseName (const QString &path, const QString &filename, QVariant ∗counter=nullptr, QVariant ∗intermediateCounter=nullptr)=0

  Analyzes the given file name.
- virtual QString directory (const QString &path, const QString &filename)=0

  For a loaded file in directory path and with file name filename, returns the directory in which a new version (a new intermediate version, resp.) shall be stored.
- virtual QVariant incrementedCounter (const QVariant &counter)=0

Returns the given counter "incremented", that is, changed in a steady, repeatable fashion.

- virtual QVariant initialCounter ()=0

  Returns an initial counter value for version and intermediate number counters.

- virtual QString **intermediateDirectory** (const QString &currentPath, const QString &fileName)=0
- virtual QString intermediateFileName (const QString &path, const QString &filename, const QVariant &version, const QVariant &counter)=0

  Creates a version file name for an intermediate file in given directory, as previously returned by directory(), given baseName, as previously returned by baseName, version and intermediate number counter.

- virtual QString versionFileName (const QString &path, const QString &baseName, const QVariant &counter)=0

  Creates a version file name for a file in given directory, as previously returned by directory(), given baseName, as previously returned by baseName, and version counter.

6.1356.1 Member Function Documentation

6.1356.1.1 baseName()

```
virtual QString Digikam::VersionNamingScheme::baseName (
            const QString & path,
            const QString & filename,
            QVariant * counter = nullptr,
            QVariant * intermediateCounter = nullptr )  [pure virtual]
```

Returns the basename in the sense of stripping the file name of all added version information: A scheme that appends a number, like "MyFile-1.jpg", shall return "MyFile". Path is the directory, filename the file name, so path + filename is the file path. If counter is given, and the given file name has a version number, write it to counter. If intermediateCounter is given, and the given file name has an intermediate counter number, write it to counter. If not available, do not touch the given counters. See initialCounter() for the valid counter formats.

Implemented in Digikam::DefaultVersionNamingScheme.

6.1356.1.2 directory()

```
virtual QString Digikam::VersionNamingScheme::directory (
            const QString & path,
            const QString & filename )  [pure virtual]
```

Implemented in Digikam::DefaultVersionNamingScheme.

6.1356.1.3 incrementedCounter()

```
virtual QVariant Digikam::VersionNamingScheme::incrementedCounter (
            const QVariant & counter )  [pure virtual]
```

You shall never return the given counter.

Implemented in Digikam::DefaultVersionNamingScheme.

6.1356.1.4 initialCounter()

```
virtual QVariant Digikam::VersionNamingScheme::initialCounter ( )  [pure virtual]
```

There are two places where you shall generate counters You will receive the given QVariant in incrementedCounter(), versionFileName() and baseName(), and you shall read a counter value from a generated file name in baseName().

Implemented in Digikam::DefaultVersionNamingScheme.

6.1356.1.5 intermediateFileName()

```
virtual QString Digikam::VersionNamingScheme::intermediateFileName (
            const QString & path,
            const QString & filename,
            const QVariant & version,
            const QVariant & counter )  [pure virtual]
```

Do not append a file suffix. You do not need to check if the file exists.

Implemented in Digikam::DefaultVersionNamingScheme.

6.1356.1.6 versionFileName()

```
virtual QString Digikam::VersionNamingScheme::versionFileName (
            const QString & path,
            const QString & baseName,
            const QVariant & counter )  [pure virtual]
```

Do not append a file suffix. You do not need to check if the file exists.

Implemented in Digikam::DefaultVersionNamingScheme.

Public Types

- enum DeactivatingMode { FlushSignals , KeepSignals , PhaseOut }
- enum **State** { **Inactive** , **Scheduled** , **Running** , **Deactivating** }

Public Slots

- void deactivate (DeactivatingMode mode=FlushSignals)

  Quits execution of this worker object.
- void **schedule** ()

  Starts execution of this worker object: The object is moved to a thread and an event loop started, so that queued signals will be received.

Signals

- void **finished** ()
- void **started** ()

Public Member Functions

- WorkerObject ()

  Deriving from a worker object allows you to execute your slots in a thread.
- bool connectAndSchedule (const QObject ∗sender, const char ∗signal, const char ∗method, Qt::↩ ConnectionType type=Qt::AutoConnection) const

  You must normally call schedule() to ensure that the object is active when you send a signal with work data.
- QThread::Priority **priority** () const
- void setPriority (QThread::Priority priority)

  Sets the priority for this dynamic thread.
- State **state** () const

- void **run** ()
- void **setEventLoop** (QEventLoop ∗loop)
- void shutDown ()

- void **transitionToInactive** ()
- bool **transitionToRunning** ()

6.1381.1 Member Enumeration Documentation

6.1381.1.1 DeactivatingMode

```
enum Digikam::WorkerObject::DeactivatingMode
```

Enumerator

FlushSignals	Already sent signals are cleared.
KeepSignals	The thread is stopped, but already sent signals remain in the queue.
PhaseOut	The thread is stopped when all signals emitted until now have been processed.

6.1381.2 Constructor & Destructor Documentation

6.1381.2.1 WorkerObject()

```
Digikam::WorkerObject::WorkerObject ( )  [explicit]
```

Implement any slots and connect signals just as usual. Call schedule() before or when signals are emitted. The object will have moved to a thread when the signals are received by the slots. Call deactivate() to stop computation. Note that without calling schedule(), no signal will ever be processed. You can use the connectAndSchedule convenience connection to avoid having to call schedule() directly. Note that you cannot make this QObject the child of another QObject. Please check if you need to call shutDown from your destructor (see below).

6.1381.3 Member Function Documentation

6.1381.3.1 aboutToDeactivate()

```
void Digikam::WorkerObject::aboutToDeactivate ( )  [protected], [virtual]
```

You can stop any extra controlled threads here. Immediately afterwards, an event will be sent to the working thread which will cause the event loop to quit. (aboutToQuitLoop())

6.1381.3.2 aboutToQuitLoop()

```
void Digikam::WorkerObject::aboutToQuitLoop ( )  [protected], [virtual]
```

Quit any blocking operation. Immediately afterwards, the event loop will be quit.

6.1381.3.3 connectAndSchedule()

```
bool Digikam::WorkerObject::connectAndSchedule (
            const QObject * sender,
            const char * signal,
            const char * method,
            Qt::ConnectionType type = Qt::AutoConnection ) const
```

Instead, you can use these connect() methods when connecting your signal to this object, the signal that carries work data. Then the object will be scheduled each time you emit the signal.

6.1381.3.4 deactivate

```
void Digikam::WorkerObject::deactivate (
            DeactivatingMode mode = FlushSignals )  [slot]
```

If mode is FlushSignals, all already emitted signals will be cleared. If mode is KeepSignals, already emitted signals are not cleared and will be kept in the event queue until destruction or schedule() is called. If mode is PhaseOut, already emitted signals will be processed and the thread quit immediately afterwards.

6.1381.3.5 setPriority()

```
void Digikam::WorkerObject::setPriority (
            QThread::Priority priority )
```

Can be set anytime. If the thread is currently not running, the priority will be set when it is run next time. When you set QThread::InheritPriority (default), the priority is not changed but inherited from the thread pool.

6.1381.3.6 shutDown()

```
void Digikam::WorkerObject::shutDown ( )  [protected]
```

Note

This irrevocably stops this object.

It is not sufficient that your parent class does this. Calling this method, or providing one of the above mentioned equivalent guarantees, must be done by every single last class in the hierarchy with an implemented destructor deleting data. (the base class destructor is always called after the derived class)

6.1403.1 Member Function Documentation

6.1403.1.1 addOverlay()

```
void ShowFoto::ShowfotoCategorizedView::addOverlay (
            ItemDelegateOverlay * overlay,
            ShowfotoDelegate * delegate = nullptr )
```

It will as well be removed automatically when destroyed. Unless you pass a different delegate, the current delegate will be used.

6.1403.1.2 deselected

```
void ShowFoto::ShowfotoCategorizedView::deselected (
            const QList< ShowfotoItemInfo > & nowDeselectedInfos )  [signal]
```

There may be other selected infos left. This signal is not emitted when the model is reset; then only selectionCleared is emitted.

6.1403.1.3 dragDropHandler()

```
AbstractItemDragDropHandler * ShowFoto::ShowfotoCategorizedView::dragDropHandler ( ) const
[override], [protected], [virtual]
```

Implements Digikam::DragDropViewImplementation.

```

The default implementation returns the next remaining sibling.

Reimplemented from Digikam::ItemViewCategorized.

6.1403.1.7 nextInOrder()

```
ShowfotoItemInfo ShowFoto::ShowfotoCategorizedView::nextInOrder (
            const ShowfotoItemInfo & startingPoint,
            int nth )
```

Specifically, return the previous info for nth = -1 and the next info for n = 1. Returns a null info if either startingPoint or the nth info are not contained in the model

6.1403.1.8 selected

```
void ShowFoto::ShowfotoCategorizedView::selected (
            const QList< ShowfotoItemInfo > & newSelectedInfos )  [signal]
```

6.1408.1 Member Enumeration Documentation

6.1408.1.1 ShowfotoFilterModelRoles

enum ShowFoto::ShowfotoFilterModel::ShowfotoFilterModelRoles

Enumerator

CategorizationModeRole	Returns the current categorization mode.
SortOrderRole	Returns the current sort order.
CategoryFormatRole	Returns the format of the index which is used for category.
ShowfotoFilterModelPointerRole	Returns true if the given showfoto item is a group leader, and the group is opened. TODO: GroupIsOpenRole = ShowfotoItemModel::FilterModelRoles + 4

6.1408.2 Member Function Documentation

6.1408.2.1 categoryIdentifier()

```
QString ShowFoto::ShowfotoFilterModel::categoryIdentifier (
            const ShowfotoItemInfo & info ) const  [protected], [virtual]
```

The string need not be for user display.

6.1408.2.2 compareCategories()

```
int ShowFoto::ShowfotoFilterModel::compareCategories (
            const QModelIndex & left,
            const QModelIndex & right ) const  [override], [protected], [virtual]
```

Internally and if not reimplemented, this method will ask for `left` and `right` models for role CategorySortRole. In order to correctly sort categories, the data() method of the model should return a qlonglong (or numeric) value, or a QString object. QString objects will be sorted with QString::localeAwareCompare if sortCategoriesByNaturalComparison() is true.

Note

Please have present that: QString(QChar(QChar::ObjectReplacementCharacter)) > QString(QChar(QChar::ReplacementCharacter)) > [all possible strings] > QString();

This means that QString() will be sorted the first one, while QString(QChar(QChar::ObjectReplacementCharacter)) and QString(QChar(QChar::ReplacementCharacter)) will be sorted in last position.

Warning

Please note that data() method of the model should return always information of the same type. If you return a QString for an index, you should return always QStrings for all indexes for role CategorySortRole in order to correctly sort categories. You cannot mix by returning a QString for one index, and a qlonglong for other.

Note

If you need a more complex layout, you will have to reimplement this method.

Returns

A negative value if the category of `left` should be placed before the category of `right`. 0 if `left` and `right` are on the same category, and a positive value if the category of `left` should be placed after the category of `right`.

Reimplemented from Digikam::DCategorizedSortFilterProxyModel.

6.1408.2.3 infosLessThan()

```
bool ShowFoto::ShowfotoFilterModel::infosLessThan (
            const ShowfotoItemInfo & left,
            const ShowfotoItemInfo & right ) const  [protected], [virtual]
```

Do not take categories into account here.

6.1408.2.4 setDirectSourceShowfotoModel()

```
void ShowFoto::ShowfotoFilterModel::setDirectSourceShowfotoModel (
            ShowfotoItemModel *const sourceModel )  [override], [protected], [virtual]
```

Reimplemented from ShowFoto::ShowfotoSortFilterModel.

6.1408.2.5 showfotoFilterModel()

```
ShowfotoFilterModel * ShowFoto::ShowfotoFilterModel::showfotoFilterModel ( ) const  [override],
[virtual]
```

Reimplemented from ShowFoto::ShowfotoSortFilterModel.

6.1408.2.6 subSortLessThan()

```
bool ShowFoto::ShowfotoFilterModel::subSortLessThan (
            const QModelIndex & left,
            const QModelIndex & right ) const  [override], [protected], [virtual]
```

It is used for sorting items that are in the same category.

Returns

Returns true if the item `left` is less than the item `right` when sorting.

Reimplemented from Digikam::DCategorizedSortFilterProxyModel.

6.1421.1 Member Enumeration Documentation

6.1421.1.1 ShowfotoItemModelRoles

```
enum ShowFoto::ShowfotoItemModel::ShowfotoItemModelRoles
```

Enumerator

ShowfotoItemModelPointerRole	An ShowfotoItemModel* pointer to this model.
ThumbnailRole	Returns a thumbnail pixmap. May be implemented by subclasses. Returns either a valid pixmap or a null QVariant.
ExtraDataRole	Return (optional) extraData field.
ExtraDataDuplicateCount	Returns the number of duplicate indexes for the same image id.

6.1421.2 Member Function Documentation

6.1421.2.1 addShowfotoItemInfoSynchronously()

```
void ShowFoto::ShowfotoItemModel::addShowfotoItemInfoSynchronously (
            const ShowfotoItemInfo & info )
```

This method first adds the info, synchronously. Only afterwards, the preprocessor will have the opportunity to process it. This method also bypasses any incremental updates.

6.1421.2.2 allRefreshingFinished

```
void ShowFoto::ShowfotoItemModel::allRefreshingFinished ( )  [signal]
```

The model is in polished, clean situation right now.

6.1421.2.3 indexForUrl()

```
QModelIndex ShowFoto::ShowfotoItemModel::indexForUrl (
            const QUrl & fileUrl ) const
```

In case of multiple occurrences of the same file, the simpler overrides returns any one found first, use the QList methods to retrieve all occurrences.

6.1421.2.4 itemInfosAboutToBeAdded

```
void ShowFoto::ShowfotoItemModel::itemInfosAboutToBeAdded (
            const QList< ShowfotoItemInfo > & infos )  [signal]
```

This signal is sent before the model data is changed and views are informed.

6.1421.2.5 itemInfosAboutToBeRemoved

```
void ShowFoto::ShowfotoItemModel::itemInfosAboutToBeRemoved (
            const QList< ShowfotoItemInfo > & infos )  [signal]
```

This signal is sent before the model data is changed and views are informed. Note: You need to explicitly enable sending of this signal. It is not sent in clearShowfotoItemInfos().

6.1421.2.6 itemInfosAdded

```
void ShowFoto::ShowfotoItemModel::itemInfosAdded (
            const QList< ShowfotoItemInfo > & infos )  [signal]
```

This signal is sent after the model data is changed and views are informed.

6.1421.2.7 itemInfosRemoved

```
void ShowFoto::ShowfotoItemModel::itemInfosRemoved (
            const QList< ShowfotoItemInfo > & infos )  [signal]
```

This signal is sent after the model data is changed and views are informed. Note: You need to explicitly enable sending of this signal. It is not sent in clearShowfotoItemInfos().

6.1421.2.8 readyForIncrementalRefresh

```
void ShowFoto::ShowfotoItemModel::readyForIncrementalRefresh ( )  [signal]
```

This is guaranteed only for the scope of emitting this signal.

6.1421.2.9 requestIncrementalRefresh()

```
void ShowFoto::ShowfotoItemModel::requestIncrementalRefresh ( )  [protected]
```

The signal will be emitted inline if the model is ready right now.

6.1421.2.10 setKeepsFileUrlCache()

```
void ShowFoto::ShowfotoItemModel::setKeepsFileUrlCache (
            bool keepCache )
```

Default is false.

6.1421.2.11 setSendRemovalSignals()

```
void ShowFoto::ShowfotoItemModel::setSendRemovalSignals (
            bool send )
```

Enable sending of itemInfosAboutToBeRemoved and itemsInfosRemoved signals. Default: false

6.1421.2.12 showfotoItemInfo() [1/2]

```
ShowfotoItemInfo ShowFoto::ShowfotoItemModel::showfotoItemInfo (
            const QModelIndex & index ) const
```

For ShowfotoItemInfo and ShowfotoItemInfoId If the index is not valid they will return a null ShowfotoItemInfo, and 0 respectively, ShowfotoItemInfoRef must not be called with an invalid index as it will crash.

6.1421.2.13 showfotoItemInfo() [2/2]

```
ShowfotoItemInfo ShowFoto::ShowfotoItemModel::showfotoItemInfo (
            int row ) const
```

Note that ShowfotoItemInfoRef must not be called with an invalid index as it will crash.

6.1421.2.14 showfotoItemInfosCleared()

```
virtual void ShowFoto::ShowfotoItemModel::showfotoItemInfosCleared ( )  [inline], [protected],
[virtual]
```

Reimplemented in ShowFoto::ShowfotoThumbnailModel.

6.1421.2.15 startIncrementalRefresh()

```
void ShowFoto::ShowfotoItemModel::startIncrementalRefresh ( )  [protected]
```

You shall only call this method from a slot connected to readyForIncrementalRefresh(). To initiate an incremental refresh, call requestIncrementalRefresh().

6.1444.1 Constructor & Destructor Documentation

6.1444.1.1 ShowfotoThumbnailModel()

```
ShowFoto::ShowfotoThumbnailModel::ShowfotoThumbnailModel (
            QWidget *const parent )  [explicit]
```

You need to set a ThumbnailLoadThread to enable thumbnail loading. Adjust the thumbnail size to your needs. Note that setKeepsFilePatindexesForPathhCache is enabled per default.

6.1444.2 Member Function Documentation

6.1444.2.1 data()

```
QVariant ShowFoto::ShowfotoThumbnailModel::data (
            const QModelIndex & index,
            int role = Qt::DisplayRole ) const  [override]
```

If the pixmap is available, returns it in the QVariant. If it still needs to be loaded, returns a null QVariant and emits thumbnailAvailable() as soon as it is available.

6.1444.2.2 setData()

```
bool ShowFoto::ShowfotoThumbnailModel::setData (
            const QModelIndex & index,
            const QVariant & value,
            int role = Qt::DisplayRole )  [override]
```

Set a null QVariant to use the thumbnail size set by setThumbnailSize() again. The index given here is ignored for this purpose.

6.1444.2.3 setEmitDataChanged()

```
void ShowFoto::ShowfotoThumbnailModel::setEmitDataChanged (
            bool emitSignal )
```

The thumbnailAvailable() signal will be emitted in any case. Default is true.

6.1444.2.4 setPreloadThumbnails()

```
void ShowFoto::ShowfotoThumbnailModel::setPreloadThumbnails (
            bool preload )
```

Default: false.

6.1444.2.5 setThumbnailLoadThread()

```
void ShowFoto::ShowfotoThumbnailModel::setThumbnailLoadThread (
            ThumbnailLoadThread * thread )
```

The thumbnail size of this thread will be adjusted.

6.1444.2.6 showfotoItemInfosCleared()

```
void ShowFoto::ShowfotoThumbnailModel::showfotoItemInfosCleared ( )  [override], [protected],
[virtual]
```

Reimplemented from ShowFoto::ShowfotoItemModel.
