

Package ‘ALL’

April 23, 2026

Title A data package
Version 1.53.0
Date 2009-07-22
Author Xiaochun Li
Description Data of T- and B-cell Acute Lymphocytic Leukemia from the Ritz Laboratory at the DFCI (includes Apr 2004 versions)
Maintainer Robert Gentleman <rgentlem@gmail.com>
License Artistic-2.0
Depends R (>= 2.10), Biobase (>= 2.5.5)
Suggests rpart
biocViews ExperimentData, CancerData, LeukemiaCancerData
git_url <https://git.bioconductor.org/packages/ALL>
git_branch devel
git_last_commit 87eda8b
git_last_commit_date 2025-10-29
Repository Bioconductor 3.24
Date/Publication 2026-04-23

ALL	<i>Acute Lymphoblastic Leukemia Data from the Ritz Laboratory</i>
-----	---

Description

The data consist of microarrays from 128 different individuals with acute lymphoblastic leukemia (ALL). A number of additional covariates are available. The data have been normalized (using rma) and it is the jointly normalized data that are available here. The data are presented in the form of an exprSet object.

Usage

data(ALL)

Format

The different covariates are:

- `cod`: The patient IDs.
- `diagnosis`: The date of diagnosis.
- `sex`: The sex of the patient, coded as M and F.
- `age`: The age of the patient in years.
- `BT`: The type and stage of the disease; B indicates B-cell ALL while a T indicates T-cell ALL.
- `remission`: A factor with two levels, either CR indicate that remission was achieved or REF indicating that the patient was refractory and remission was not achieved.
- `CR`: A vector with the following values: 1: "CR", remission achieved; 2: "DEATH IN CR", patient died while in remission; 3: "DEATH IN INDUCTION", patient died while in induction therapy; 4: "REF", patient was refractory to therapy.
- `date.cr`: The date on which remission was achieved.
- `t(4;11)`: A logical vector indicating whether a t(4;11) translocation was detected.
- `t(9;22)`: A logical vector indicating whether a t(9;22) translocation was detected.
- `cyto.normal`: A logical vector indicating whether the cytogenetics were normal.
- `citog`: A vector indicating the various cytogenetic abnormalities that were detected.
- `mol.bio1`: The assigned molecular biology of the cancer (mainly for those with B-cell ALL), BCRVABL, ALLVAF4, E2APBX etc.
- `fusion protein`: For those with BCRVABL which of the fusion proteins was detected, p190, p190\p210, p210.
- `mdr`: The patients response to multidrug resistance, either NEG, or POS.
- `kinet`: ploidy, either diploid or hyperd.
- `ccr`: A vector indicating whether the patient had continuous complete remission nor not.
- `relapse`: A vector indicating whether the patient had relapse or not.
- `transplant`: Did the patient receive a bone marrow transplant or not.
- `f.u`: Follow-up data. The possible values are 1: "AUBMT V REL": autologous bone marrow transplant and subsequent relapse; 2: "BMT V CCR": allogeneic bone marrow transplant and still in continuous complete remission; 3: "BMT V DEATH IN CR": after allogeneic bone marrow transplant patient died without relapsing; 4: "BMT V REL": after allogeneic bone marrow transplant patient relapsed; 5: "CCR": patient was in continuous complete remission; 6: "CCR V OFF": patient was in continuous complete remission but off-protocol for some reasons; 7: "DEATH IN CR": died when in complete remission; 8: "MUD V DEATH IN CR": unrelated allogeneic bone marrow transplant and death without relapsing; 9: "REL": relapse; 10: "REL V SNC": relapse occurred at central nervous system.
- `date last seen`: Date the patient was last seen.

tojulian
```

Convert Calendar Date to Julian Time

Description

Convert Calendar Date in the form of "%m/%d/%Y" to Julian time, number of days since 1970-01-01 in the time zone of "GMT".

Usage

```
tojulian(x)
```

Arguments

x Date to convert

Author(s)

Robert Gentleman

Examples

```
ds <- tojulian(c("4/8/2000", "4/30/2000"))
ds[2]-ds[1]
```
