

Package ‘CPGLIB’

March 30, 2025

Type Package

Title Competing Proximal Gradients Library

Version 1.1.2

Date 2025-03-30

Maintainer Anthony Christidis <anthony.christidis@stat.ubc.ca>

Description Functions to generate ensembles of generalized linear models using competing proximal gradients. The optimal sparsity and diversity tuning parameters are selected via an alternating grid search.

License GPL (>= 2)

Biarch true

Imports Rcpp (>= 1.0.3)

LinkingTo Rcpp, RcppArmadillo

RoxygenNote 7.1.1

Suggests testthat, vctrs, mvnfast

NeedsCompilation yes

<code>coef.CPGLIB</code>	<i>Coefficients for CPGLIB Object</i>
--------------------------	---------------------------------------

Description

`coef.CPGLIB` returns the coefficients for a CPGLIB object.

Usage

```
## S3 method for class 'CPGLIB'
coef(object, groups = NULL, ensemble_average = FALSE, ...)
```

Arguments

- `object` An object of class CPGLIB.
- `groups` The groups in the ensemble for the coefficients. Default is all of the groups in the ensemble.
- `ensemble_average` Option to return the average of the coefficients over all the groups in the ensemble. Default is FALSE.
- `...` Additional arguments for compatibility.

Value

The coefficients for the CPGLIB object.

Author(s)

Anthony-Alexander Christidis, <anthony.christidis@stat.ubc.ca>

coef.cv.ProxGrad

Coefficients for cv.ProxGrad Object

Description

`coef.cv.ProxGrad` returns the coefficients for a `cv.ProxGrad` object.

Usage

```
## S3 method for class 'cv.ProxGrad'
coef(object, ...)
```

Arguments

<code>object</code>	An object of class <code>cv.ProxGrad</code> .
<code>...</code>	Additional arguments for compatibility.

Value

The coefficients for the `cv.ProxGrad` object.

cpg

Competing Proximal Gradients Library for Ensembles of Generalized Linear Models

Description

cpg computes the coefficients for ensembles of generalized linear models via competing proximal gradients.

Usage

```
cpg(
  x,
  y,
  glm_type = c("Linear", "Logistic")[1],
  G = 5,
  include_intercept = TRUE,
  alpha_s = 3/4,
  alpha_d = 1,
  lambda_sparsity,
  lambda_diversity,
  tolerance = 1e-08,
  max_iter = 1e+05
)
```

Arguments

x	Design matrix.
y	Response vector.
glm_type	Description of the error distribution and link function to be used for the model. Must be one of "Linear" or "Logistic". Default is "Linear".
G	Number of groups in the ensemble.
include_intercept	Argument to determine whether there is an intercept. Default is TRUE.
alpha_s	Sparsity mixing parameter. Default is 3/4.
alpha_d	Diversity mixing parameter. Default is 1.
lambda_sparsity	Sparsity tuning parameter value.
lambda_diversity	Diversity tuning parameter value.
tolerance	Convergence criteria for the coefficients. Default is 1e-8.
max_iter	Maximum number of iterations in the algorithm. Default is 1e5.

Value

An object of class cpg

cv.cpg*Competing Proximal Gradients Library for Ensembles of Generalized Linear Models - Cross-Validation***Description**

`cv.cpg` computes and cross-validates the coefficients for ensembles of generalized linear models via competing proximal gradients.

Usage

```
cv.cpg(
  x,
  y,
  glm_type = c("Linear", "Logistic")[1],
  G = 5,
  full_diversity = FALSE,
  include_intercept = TRUE,
  alpha_s = 3/4,
  alpha_d = 1,
  n_lambda_sparsity = 100,
  n_lambda_diversity = 100,
  tolerance = 1e-08,
  max_iter = 1e+05,
  n_folds = 10,
  n_threads = 1
)
```

Arguments

<code>x</code>	Design matrix.
<code>y</code>	Response vector.
<code>glm_type</code>	Description of the error distribution and link function to be used for the model. Must be one of "Linear" or "Logistic". Default is "Linear".
<code>G</code>	Number of groups in the ensemble.
<code>full_diversity</code>	Argument to determine if the overlap between the models should be zero. Default is FALSE.
<code>include_intercept</code>	Argument to determine whether there is an intercept. Default is TRUE.
<code>alpha_s</code>	Sparsity mixing parameter. Default is 3/4.

```

alpha_d          Diversity mixing parameter. Default is 1.
n_lambda_sparsity
                  Number of candidates for sparsity tuning parameter. Default is 100.
n_lambda_diversity
                  Number of candidates for diversity tuning parameter. Default is 100.
tolerance        Convergence criteria for the coefficients. Default is 1e-8.
max_iter         Maximum number of iterations in the algorithm. Default is 1e5.
n_folds          Number of cross-validation folds. Default is 10.
n_threads        Number of threads. Default is a single thread.

```

Value

An object of class `cv.cpg`

Description

cv.ProxGrad computes and cross-validates the coefficients for generalized linear models using proximal gradients.

Usage

```

cv.ProxGrad(
  x,
  y,
  glm_type = c("Linear", "Logistic")[1],
  include_intercept = TRUE,
  alpha_s = 3/4,
  n_lambda_sparsity = 100,
  tolerance = 1e-08,
  max_iter = 1e+05,
  n_folds = 10,
  n_threads = 1
)

```

Arguments

x	Design matrix.
y	Response vector.
glm_type	Description of the error distribution and link function to be used for the model. Must be one of "Linear" or "Logistic". Default is "Linear".

```

include_intercept
    Argument to determine whether there is an intercept. Default is TRUE.

alpha_s
    Elastic net mixing parameter. Default is 3/4.

n_lambda_sparsity
    Sparsity tuning parameter value. Default is 100.

tolerance
    Convergence criteria for the coefficients. Default is 1e-8.

max_iter
    Maximum number of iterations in the algorithm. Default is 1e5.

n_folds
    Number of cross-validation folds. Default is 10.

n_threads
    Number of threads. Default is a single thread.

```

Value

An object of class cv.ProxGrad

`predict.CPGLIB`*Predictions for CPGLIB Object***Description**

`predict.CPGLIB` returns the predictions for a CPGLIB object.

Usage

```

## S3 method for class 'CPGLIB'
predict(
  object,
  newx,
  groups = NULL,
  ensemble_type = c("Model-Avg", "Coef-Avg", "Weighted-Prob", "Majority-Vote")[1],
  class_type = c("prob", "class")[1],
  ...
)

```

Arguments

<code>object</code>	An object of class CPGLIB.
<code>newx</code>	New data for predictions.
<code>groups</code>	The groups in the ensemble for the predictions. Default is all of the groups in the ensemble.
<code>ensemble_type</code>	The type of ensembling function for the models. Options are "Model-Avg", "Coef-Avg" or "Weighted-Prob" for classifications predictions. Default is "Model-Avg".
<code>class_type</code>	The type of predictions for classification. Options are "prob" and "class". Default is "prob".
<code>...</code>	Additional arguments for compatibility.

Value

The predictions for the CPGLIB object.

| <code>groups</code> | The groups in the ensemble for the predictions. Default is all of the groups in the ensemble. |
| <code>ensemble_type</code> | The type of ensembling function for the models. Options are "Model-Avg", "Coef-Avg" or "Weighted-Prob" for classifications predictions. Default is "Model-Avg". |
| <code>class_type</code> | The type of predictions for classification. Options are "prob" and "class". Default is "prob". |
| <code>...</code> | Additional arguments for compatibility. |

Value

The predictions for the `cv.CPGLIB` object.

predict.cv.ProxGrad *Predictions for cv.ProxGrad Object*

Description

`predict.cv.ProxGrad` returns the predictions for a ProxGrad object.

Usage

```
## S3 method for class 'cv.ProxGrad'
predict(object, newx, type = c("prob", "class")[1], ...)
```

Arguments

<code>object</code>	An object of class <code>cv.ProxGrad</code> .
<code>newx</code>	New data for predictions.
<code>type</code>	The type of predictions for binary response. Options are "prob" (default) and "class".
...	Additional arguments for compatibility.

Value

The predictions for the `cv.ProxGrad` object.

abline(h = 0.5, v = 0.5)
mean((prob.test-proxgrad.prob)^2)
mean(abs(y.test-proxgrad.class))
```

Description

ProxGrad computes the coefficients for generalized linear models using proximal gradients.

Usage

```
ProxGrad(
  x,
  y,
  glm_type = c("Linear", "Logistic")[1],
  include_intercept = TRUE,
  alpha_s = 3/4,
  lambda_sparsity,
  tolerance = 1e-08,
  max_iter = 1e+05
)
```

Arguments

x	Design matrix.
y	Response vector.
glm_type	Description of the error distribution and link function to be used for the model. Must be one of "Linear" or "Logistic". Default is "Linear".
include_intercept	Argument to determine whether there is an intercept. Default is TRUE.
alpha_s	Elastic net mixing parameter. Default is 3/4.
lambda_sparsity	Sparsity tuning parameter value.
tolerance	Convergence criteria for the coefficients. Default is 1e-8.
max_iter	Maximum number of iterations in the algorithm. Default is 1e5.

Value

An object of class ProxGrad.
