

Package ‘DiscreteDists’

January 20, 2025

Title Discrete Statistical Distributions

Version 1.0.0

Description Implementation of new discrete statistical distributions. Each distribution includes the traditional functions as well as an additional function called the family function, which can be used to estimate parameters within the 'gamlss' framework.

add	<i>Sum of One-Dimensional Functions</i>
------------	---

Description

Sum of One-Dimensional Functions

Usage

```
add(f, lower, upper, ..., abs.tol = .Machine$double.eps)
```

Arguments

<code>f</code>	an R function taking a numeric first argument and returning a numeric vector of the same length.
<code>lower</code>	the lower limit of sum. Can be infinite.
<code>upper</code>	the upper limit of sum. Can be infinite.
<code>...</code>	additional arguments to be passed to <code>f</code> .
<code>abs.tol</code>	absolute accuracy requested.

Value

This function returns the sum value.

Author(s)

Freddy Hernandez, <fhernanb@unal.edu.co>

Examples

```
# Poisson expected value
add(f=function(x, lambda) x*dpois(x, lambda), lower=0, upper=Inf,
lambda=7.5)

# Binomial expected value
add(f=function(x, size, prob) x*dbinom(x, size, prob), lower=0, upper=20,
size=20, prob=0.5)

# Examples with infinite series
add(f=function(x) 0.5^x, lower=0, upper=100) # Ans=2
add(f=function(x) (1/3)^(x-1), lower=1, upper=Inf) # Ans=1.5
add(f=function(x) 4/(x^2+3*x+2), lower=0, upper=Inf, abs.tol=0.001) # Ans=4.0
add(f=function(x) 1/(x*(log(x)^2)), lower=2, upper=Inf, abs.tol=0.000001) # Ans=2.02
add(f=function(x) 3*0.7^(x-1), lower=1, upper=Inf) # Ans=10
add(f=function(x, a, b) a*b^(x-1), lower=1, upper=Inf, a=3, b=0.7) # Ans=10
add(f=function(x, a=3, b=0.7) a*b^(x-1), lower=1, upper=Inf) # Ans=10
```

DBH

*The Discrete Burr Hatke family***Description**

The function DBH() defines the Discrete Burr Hatke distribution, one-parameter discrete distribution, for a `gamlss.family` object to be used in GAMLSS fitting using the function `gamlss()`.

Usage

```
DBH(mu.link = "logit")
```

Arguments

<code>mu.link</code>	defines the <code>mu.link</code> , with "logit" link as the default for the <code>mu</code> parameter. Other links are "probit" and "cloglog"(complementary log-log)
----------------------	--

Details

The Discrete Burr-Hatke distribution with parameters μ has a support $0, 1, 2, \dots$ and density given by

$$f(x|\mu) = \left(\frac{1}{x+1} - \frac{\mu}{x+2}\right)\mu^x$$

The pmf is log-convex for all values of $0 < \mu < 1$, where $\frac{f(x+1;\mu)}{f(x;\mu)}$ is an increasing function in x for all values of the parameter μ .

Note: in this implementation we changed the original parameters λ for μ , we did it to implement this distribution within `gamlss` framework.

Value

Returns a `gamlss.family` object which can be used to fit a Discrete Burr-Hatke distribution in the `gamlss()` function.

Examples

```
# Example 1
# Generating some random values with
# known mu
y <- rDBH(n=1000, mu=0.74)

library(gamlss)
mod1 <- gamlss(y~1, family=DBH,
                 control=gamlss.control(n.cyc=500, trace=FALSE))

# Extracting the fitted values for mu
# using the inverse logit function
inv_logit <- function(x) exp(x) / (1+exp(x))
inv_logit(coef(mod1, parameter="mu"))

# Example 2
# Generating random values under some model

# A function to simulate a data set with Y ~ DBH
gendat <- function(n) {
  x1 <- runif(n)
  mu    <- inv_logit(-3 + 5 * x1)
  y <- rDBH(n=n, mu=mu)
  data.frame(y=y, x1=x1)
}

datos <- gendat(n=150)

mod2 <- NULL
mod2 <- gamlss(y~x1, family=DBH, data=datos,
                 control=gamlss.control(n.cyc=500, trace=FALSE))

summary(mod2)
```

```

# Example 3
# number of carious teeth among the four deciduous molars.
# Taken from EL-MORSHEY (2020) page 74364.

y <- rep(0:4, times=c(64, 17, 10, 6, 3))

mod3 <- gamlss(y~1, family=DBH,
                 control=gamlss.control(n.cyc=500, trace=FALSE))

# Extracting the fitted values for mu
# using the inverse link function
inv_logit <- function(x) 1/(1 + exp(-x))
inv_logit(coef(mod3, what="mu"))

```

Description

These functions define the density, distribution function, quantile function and random generation for the Discrete Burr Hatke distribution with parameter μ .

Usage

```

dDBH(x, mu, log = FALSE)

pDBH(q, mu, lower.tail = TRUE, log.p = FALSE)

qDBH(p, mu = 1, lower.tail = TRUE, log.p = FALSE)

rDBH(n, mu = 1)

```

Arguments

x, q	vector of (non-negative integer) quantiles.
mu	vector of the mu parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
p	vector of probabilities.
n	number of random values to return

Details

The Discrete Burr-Hatke distribution with parameters μ has a support $0, 1, 2, \dots$ and density given by

$$f(x|\mu) = \left(\frac{1}{x+1} - \frac{\mu}{x+2}\right)\mu^x$$

The pmf is log-convex for all values of $0 < \mu < 1$, where $\frac{f(x+1;\mu)}{f(x;\mu)}$ is an increasing function in x for all values of the parameter μ .

Note: in this implementation we changed the original parameters λ for μ , we did it to implement this distribution within gamlss framework.

Value

dDBH gives the density, *pDBH* gives the distribution function, *qDBH* gives the quantile function, *rDBH* generates random deviates.

      main="Quantiles of BH(mu=0.97)")

```

Description

These functions define the density, distribution function, quantile function and random generation for the Discrete generalized exponential distribution a second type with parameters μ and σ .

Usage

```
dDGEII(x, mu = 0.5, sigma = 1.5, log = FALSE)

pDGEII(q, mu = 0.5, sigma = 1.5, lower.tail = TRUE, log.p = FALSE)

rDGEII(n, mu = 0.5, sigma = 1.5)

qDGEII(p, mu = 0.5, sigma = 1.5, lower.tail = TRUE, log.p = FALSE)
```

Arguments

x, q	vector of (non-negative integer) quantiles.
mu	vector of the mu parameter.
sigma	vector of the sigma parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
n	number of random values to return.
p	vector of probabilities.

Details

The DGEII distribution with parameters μ and σ has a support $0, 1, 2, \dots$ and mass function given by

$$f(x|\mu, \sigma) = (1 - \mu^{x+1})^\sigma - (1 - \mu^x)^\sigma$$

with $0 < \mu < 1$ and $\sigma > 0$. If $\sigma = 1$, the DGEII distribution reduces to the geometric distribution with success probability $1 - \mu$.

Note: in this implementation we changed the original parameters p to μ and α to σ , we did it to implement this distribution within gamlss framework.

Value

dDGEII gives the density, pDGEII gives the distribution function, qDGEII gives the quantile function, rDGEII generates random deviates.

```

Description

These functions define the density, distribution function, quantile function and random generation for the discrete Inverted Kumaraswamy, DIKUM(), distribution with parameters μ and σ .

Usage

```

dDIKUM(x, mu = 1, sigma = 5, log = FALSE)

pDIKUM(q, mu = 1, sigma = 5, lower.tail = TRUE, log.p = FALSE)

rDIKUM(n, mu = 1, sigma = 5)

```

```
qDIKUM(p, mu = 1, sigma = 5, lower.tail = TRUE, log.p = FALSE)
```

Arguments

x, q	vector of (non-negative integer) quantiles.
mu	vector of the mu parameter.
sigma	vector of the sigma parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
n	number of random values to return.
p	vector of probabilities.

Details

The discrete Inverted Kumaraswamy distribution with parameters μ and σ has a support 0, 1, 2, ... and density given by

$$f(x|\mu, \sigma) = (1 - (2 + x)^{-\mu})^\sigma - (1 - (1 + x)^{-\mu})^\sigma$$

with $\mu > 0$ and $\sigma > 0$.

Note: in this implementation we changed the original parameters α and β for μ and σ respectively, we did it to implement this distribution within gamlss framework.

Value

dDIKUM gives the density, pDIKUM gives the distribution function, qDIKUM gives the quantile function, rDIKUM generates random deviates.

```

Description

These functions define the density, distribution function, quantile function and random generation for the Discrete Lindley distribution with parameter μ .

Usage

```

dDLD(x, mu, log = FALSE)

pDLD(q, mu, lower.tail = TRUE, log.p = FALSE)

qDLD(p, mu, lower.tail = TRUE, log.p = FALSE)

rDLD(n, mu = 0.5)

```

Arguments

x, q	vector of (non-negative integer) quantiles.
mu	vector of positive values of this parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
p	vector of probabilities.
n	number of random values to return.

Details

The Discrete Lindley distribution with parameters μ has a support $0, 1, 2, \dots$ and density given by

$$f(x|\mu) = \frac{e^{-\mu x}}{1+\mu} [\mu(1 - 2e^{-\mu}) + (1 - e^{-\mu})(1 + \mu x)]$$

Note: in this implementation we changed the original parameters θ for μ , we did it to implement this distribution within gamlss framework.

Value

dDLD gives the density, pDLD gives the distribution function, qDLD gives the quantile function, rDLD generates random deviates.

dDMOLBE*The DMOLBE distribution*

Description

These functions define the density, distribution function, quantile function and random generation for the Discrete Marshall–Olkin Length Biased Exponential DMOLBE distribution with parameters μ and σ .

Usage

```
dDMOLBE(x, mu = 1, sigma = 1, log = FALSE)
pDMOLBE(q, mu = 1, sigma = 1, lower.tail = TRUE, log.p = FALSE)
rDMOLBE(n, mu = 1, sigma = 1)
qDMOLBE(p, mu = 1, sigma = 1, lower.tail = TRUE, log.p = FALSE)
```

Arguments

<code>x, q</code>	vector of (non-negative integer) quantiles.
<code>mu</code>	vector of the mu parameter.
<code>sigma</code>	vector of the sigma parameter.
<code>log, log.p</code>	logical; if TRUE, probabilities p are given as log(p).
<code>lower.tail</code>	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
<code>n</code>	number of random values to return.
<code>p</code>	vector of probabilities.

Details

The DMOLBE distribution with parameters μ and σ has a support $0, 1, 2, \dots$ and mass function given by

$$f(x|\mu, \sigma) = \frac{\sigma((1+x/\mu)\exp(-x/\mu)-(1+(x+1)/\mu)\exp(-(x+1)/\mu))}{(1-(1-\sigma)(1+x/\mu)\exp(-x/\mu))((1-(1-\sigma)(1+(x+1)/\mu)\exp(-(x+1)/\mu))}$$

with $\mu > 0$ and $\sigma > 0$

Value

`dDMOLBE` gives the density, `pDMOLBE` gives the distribution function, `qDMOLBE` gives the quantile function, `rDMOLBE` generates random deviates.

```

Description

The function DGEII() defines the Discrete generalized exponential distribution, Second type, a two parameter distribution, for a `gamlss.family` object to be used in GAMLSS fitting using the function `gamlss()`.

Usage

```
DGEII(mu.link = "logit", sigma.link = "log")
```

Arguments

<code>mu.link</code>	defines the mu.link, with "logit" link as the default for the mu parameter. Other links are "probit" and "cloglog"(complementary log-log).
<code>sigma.link</code>	defines the sigma.link, with "log" link as the default for the sigma.

Details

The DGEII distribution with parameters μ and σ has a support $0, 1, 2, \dots$ and mass function given by

$$f(x|\mu, \sigma) = (1 - \mu^{x+1})^\sigma - (1 - \mu^x)^\sigma$$

with $0 < \mu < 1$ and $\sigma > 0$. If $\sigma = 1$, the DGEII distribution reduces to the geometric distribution with success probability $1 - \mu$.

Note: in this implementation we changed the original parameters p to μ and α to σ , we did it to implement this distribution within gamlss framework.

Value

Returns a `gamlss.family` object which can be used to fit a DGEII distribution in the `gamlss()` function.

Description

These functions define the density, distribution function, quantile function and random generation for the hyper-Poisson, HYPERPO(), distribution with parameters μ and σ .

Usage

```

dHYPERPO(x, mu = 1, sigma = 1, log = FALSE)

pHYPERPO(q, mu = 1, sigma = 1, lower.tail = TRUE, log.p = FALSE)

rHYPERPO(n, mu = 1, sigma = 1)

qHYPERPO(p, mu = 1, sigma = 1, lower.tail = TRUE, log.p = FALSE)

```

Arguments

<code>x, q</code>	vector of (non-negative integer) quantiles.
<code>mu</code>	vector of the mu parameter.
<code>sigma</code>	vector of the sigma parameter.
<code>log, log.p</code>	logical; if TRUE, probabilities p are given as log(p).
<code>lower.tail</code>	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
<code>n</code>	number of random values to return.
<code>p</code>	vector of probabilities.

Details

The hyper-Poisson distribution with parameters μ and σ has a support $0, 1, 2, \dots$ and density given by

$$f(x|\mu, \sigma) = \frac{\mu^x}{{}_1F_1(1;\mu;\sigma)} \frac{\Gamma(\sigma)}{\Gamma(x+\sigma)}$$

where the function ${}_1F_1(a; c; z)$ is defined as

$${}_1F_1(a; c; z) = \sum_{r=0}^{\infty} \frac{(a)_r z^r}{(c)_r r!}$$

and $(a)_r = \frac{\gamma(a+r)}{\gamma(a)}$ for $a > 0$ and r positive integer.

Note: in this implementation we changed the original parameters λ and γ for μ and σ respectively, we did it to implement this distribution within gamlss framework.

Value

`dHYPERPO` gives the density, `pHYPERPO` gives the distribution function, `qHYPERPO` gives the quantile function, `rHYPERPO` generates random deviates.

dHYPERP02

The hyper-Poisson distribution (with mu as mean)

Description

These functions define the density, distribution function, quantile function and random generation for the hyper-Poisson in the second parameterization with parameters μ (as mean) and σ as the dispersion parameter.

Usage

```

dHYPERP02(x, mu = 1, sigma = 1, log = FALSE)

pHYPERP02(q, mu = 1, sigma = 1, lower.tail = TRUE, log.p = FALSE)

rHYPERP02(n, mu = 1, sigma = 1)

qHYPERP02(p, mu = 1, sigma = 1, lower.tail = TRUE, log.p = FALSE)

```

Arguments

x, q	vector of (non-negative integer) quantiles.
mu	vector of positive values of this parameter.
sigma	vector of positive values of this parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
n	number of random values to return
p	vector of probabilities.

Details

The hyper-Poisson distribution with parameters μ and σ has a support $0, 1, 2, \dots$

Note: in this implementation the parameter μ is the mean of the distribution and σ corresponds to the dispersion parameter. If you fit a model with this parameterization, the time will increase because an internal procedure to convert μ to λ parameter.

Value

dHYPERPO2 gives the density, pHYPERPO2 gives the distribution function, qHYPERPO2 gives the quantile function, rHYPERPO2 generates random deviates.

```

Description

Function to obtain the dHYPERPO for a single value x

Usage

```
dHYPERPO_single(x, mu = 1, sigma = 1, log = FALSE)
```

Arguments

x	numeric value for x.
mu	numeric value for nu.
sigma	numeric value for sigma.
log	logical value for log.

Value

returns the pmf for a single value x.

dHYPERPO_vec

Function to obtain the dHYPERPO for a vector x

Description

Function to obtain the dHYPERPO for a vector x

Usage

```
dHYPERPO_vec(x, mu, sigma, log)
```

Arguments

x	numeric value for x.
mu	numeric value for nu.
sigma	numeric value for sigma.
log	logical value for log.

Value

returns the pmf for a vector.

Description

The function DIKUM() defines the discrete Inverted Kumaraswamy distribution, a two parameter distribution, for a `gamlss.family` object to be used in GAMLSS fitting using the function `gamlss()`.

Usage

```
DIKUM(mu.link = "log", sigma.link = "log")
```

Arguments

- `mu.link` defines the mu.link, with "log" link as the default for the mu parameter.
- `sigma.link` defines the sigma.link, with "log" link as the default for the sigma.

Details

The discrete Inverted Kumaraswamy distribution with parameters μ and σ has a support $0, 1, 2, \dots$ and density given by

$$f(x|\mu, \sigma) = (1 - (2 + x)^{-\mu})^\sigma - (1 - (1 + x)^{-\mu})^\sigma$$

with $\mu > 0$ and $\sigma > 0$.

Note: in this implementation we changed the original parameters α and β for μ and σ respectively, we did it to implement this distribution within `gamlss` framework.

Value

Returns a `gamlss.family` object which can be used to fit a discrete Inverted Kumaraswamy distribution in the `gamlss()` function.

summary(mod2)

```

Description

The function DLD() defines the Discrete Lindley distribution, one-parameter discrete distribution, for a `gamlss.family` object to be used in GAMLSS fitting using the function `gamlss()`.

Usage

```
DLD(mu.link = "log")
```

Arguments

`mu.link` defines the mu.link, with "log" link as the default for the mu parameter.

Details

The Discrete Lindley distribution with parameters $\mu > 0$ has a support $0, 1, 2, \dots$ and density given by

$$f(x|\mu) = \frac{e^{-\mu x}}{1+\mu} (\mu(1 - 2e^{-\mu}) + (1 - e^{-\mu})(1 + \mu x))$$

The parameter μ can be interpreted as a strict upper bound on the failure rate function

The conventional discrete distributions (such as geometric, Poisson, etc.) are not suitable for various scenarios like reliability, failure times, and counts. Consequently, alternative discrete distributions have been created by adapting well-known continuous models for reliability and failure times. Among these, the discrete Weibull distribution stands out as the most widely used. But models like these require two parameters and not many of the known discrete distributions can provide accurate models for both times and counts, which the Discrete Lindley distribution does.

Note: in this implementation we changed the original parameters θ for μ , we did it to implement this distribution within gamlss framework.

Value

Returns a `gamlss.family` object which can be used to fit a Discrete Lindley distribution in the `gamlss()` function.

dPOISXL*The Discrete Poisson XLindley***Description**

These functions define the density, distribution function, quantile function and random generation for the Discrete Poisson XLindley distribution with parameter μ .

Usage

```
dPOISXL(x, mu = 0.3, log = FALSE)

pPOISXL(q, mu = 0.3, lower.tail = TRUE, log.p = FALSE)

qPOISXL(p, mu = 0.3, lower.tail = TRUE, log.p = FALSE)

rPOISXL(n, mu = 0.3)
```

Arguments

<code>x, q</code>	vector of (non-negative integer) quantiles.
<code>mu</code>	vector of the mu parameter.
<code>log, log.p</code>	logical; if TRUE, probabilities p are given as log(p).
<code>lower.tail</code>	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
<code>p</code>	vector of probabilities.
<code>n</code>	number of random values to return

Details

The Discrete Poisson XLindley distribution with parameters μ has a support $0, 1, 2, \dots$ and mass function given by

$$f(x|\mu) = \frac{\mu^2(x+\mu^2+3(1+\mu))}{(1+\mu)^{4+x}}; \text{ with } \mu > 0.$$

Note: in this implementation we changed the original parameters α for μ , we did it to implement this distribution within gamlss framework.

Value

`dPOISXL` gives the density, `pPOISXL` gives the distribution function, `qPOISXL` gives the quantile function, `rPOISXL` generates random deviates.

f11_cpp

*Function to obtain F11 with C++.***Description**

Function to obtain F11 with C++.

Usage

```
f11_cpp(gamma, lambda, maxiter_series = 10000L, tol = 1e-10)
```

Arguments

gamma	numeric value for gamma.
lambda	numeric value for lambda.
maxiter_series	numeric value.
tol	numeric value.

Value

returns the F11 value.

Description

The function GGEO() defines the Generalized Geometric distribution, a two parameter distribution, for a `gamlss.family` object to be used in GAMLSS fitting using the function `gamlss()`.

Usage

```
GGEO(mu.link = "logit", sigma.link = "log")
```

Arguments

- `mu.link` defines the mu.link, with "log" link as the default for the mu parameter.
- `sigma.link` defines the sigma.link, with "logit" link as the default for the sigma. Other links are "probit" and "cloglog"(complementary log-log)

Details

The GGEO distribution with parameters μ and σ has a support $0, 1, 2, \dots$ and mass function given by

$$f(x|\mu, \sigma) = \frac{\sigma\mu^x(1-\mu)}{(1-(1-\sigma)\mu^{x+1})(1-(1-\sigma)\mu^x)}$$

with $0 < \mu < 1$ and $\sigma > 0$. If $\sigma = 1$, the GGEO distribution reduces to the geometric distribution with success probability $1 - \mu$.

Value

Returns a `gamlss.family` object which can be used to fit a GGEO distribution in the `gamlss()` function.

Description

The function HYPERPO() defines the hyper Poisson distribution, a two parameter distribution, for a `gamlss.family` object to be used in GAMLSS fitting using the function `gamlss()`.

Usage

```
HYPERPO(mu.link = "log", sigma.link = "log")
```

Arguments

- `mu.link` defines the mu.link, with "log" link as the default for the mu parameter.
- `sigma.link` defines the sigma.link, with "log" link as the default for the sigma.

Details

The hyper-Poisson distribution with parameters μ and σ has a support $0, 1, 2, \dots$ and density given by

$$f(x|\mu, \sigma) = \frac{\mu^x}{{}_1F_1(1;\mu;\sigma)} \frac{\Gamma(\sigma)}{\Gamma(x+\sigma)}$$

where the function ${}_1F_1(a; c; z)$ is defined as

$${}_1F_1(a; c; z) = \sum_{r=0}^{\infty} \frac{(a)_r z^r}{(c)_r r!}$$

and $(a)_r = \frac{\gamma(a+r)}{\gamma(a)}$ for $a > 0$ and r positive integer.

Note: in this implementation we changed the original parameters λ and γ for μ and σ respectively, we did it to implement this distribution within `gamlss` framework.

Value

Returns a `gamlss.family` object which can be used to fit a hyper-Poisson distribution in the `gamlss()` function.

Details

The hyper-Poisson distribution with parameters μ and σ has a support 0, 1, 2, ...

Note: in this implementation the parameter μ is the mean of the distribution and σ corresponds to the dispersion parameter. If you fit a model with this parameterization, the time will increase because an internal procedure to convert μ to λ parameter.

Value

Returns a `gamlss.family` object which can be used to fit a hyper-Poisson distribution version 2 in the `gamlss()` function.

mean_var_hp*Mean and variance for hyper-Poisson distribution***Description**

This function calculates the mean and variance for the hyper-Poisson distribution with parameters μ and σ .

Usage

```

mean_var_hp(mu, sigma)
mean_var_hp2(mu, sigma)

```

Arguments

mu	value of the mu parameter.
sigma	value of the sigma parameter.

Details

The hyper-Poisson distribution with parameters μ and σ has a support $0, 1, 2, \dots$ and density given by

$$f(x|\mu, \sigma) = \frac{\mu^x}{{}_1F_1(1;\mu;\sigma)} \frac{\Gamma(\sigma)}{\Gamma(x+\sigma)}$$

where the function ${}_1F_1(a; c; z)$ is defined as

$${}_1F_1(a; c; z) = \sum_{r=0}^{\infty} \frac{(a)_r z^r}{(c)_r r!}$$

and $(a)_r = \frac{\gamma(a+r)}{\gamma(a)}$ for $a > 0$ and r positive integer.

This function calculates the mean and variance of this distribution.

Value

the function returns a list with the mean and variance.

plot_discrete_cdf *Draw the CDF for a discrete random variable*

Description

Draw the CDF for a discrete random variable

Usage

```
plot_discrete_cdf(x, fx, col = "blue", lwd = 3, ...)
```

Arguments

x	vector with the values of the random variable X .
fx	vector with the probabilities of X .
col	color for the line.
lwd	line width.
...	further arguments and graphical parameters.

Value

A plot with the cumulative distribution function.

Author(s)

Freddy Hernandez, <fhernanb@unal.edu.co>

Examples

```
# Example 1
# for a particular distribution

x <- 1:6
fx <- c(0.19, 0.21, 0.4, 0.12, 0.05, 0.03)
plot_discrete_cdf(x, fx, las=1, main="")

# Example 2
# for a Poisson distribution
x <- 0:10
fx <- dpois(x, lambda=3)
plot_discrete_cdf(x, fx, las=1,
                  main="CDF for Poisson")
```

Description

The function `POISXL()` defines the Discrete Poisson XLindley distribution, one-parameter discrete distribution, for a `gamlss.family` object to be used in GAMLSS fitting using the function `gamlss()`.

Usage

```
POISXL(mu.link = "log")
```

Arguments

`mu.link` defines the mu.link, with "log" link as the default for the mu parameter.

Details

The Discrete Poisson XLindley distribution with parameters μ has a support $0, 1, 2, \dots$ and mass function given by

$$f(x|\mu) = \frac{\mu^2(x+\mu^2+3(1+\mu))}{(1+\mu)^{4+x}}; \text{ with } \mu > 0.$$

Note: in this implementation we changed the original parameters α for μ , we did it to implement this distribution within `gamlss` framework.

Value

Returns a `gamlss.family` object which can be used to fit a Discrete Poisson XLindley distribution in the `gamlss()` function.
