

# Package ‘localgauss’

October 13, 2022

**Type** Package

**Title** Estimating Local Gaussian Parameters

**Version** 0.41

**Date** 2021-10-06

**Author** Tore Selland Kleppe <tore.kleppe@uis.no>

**Maintainer** Tore Selland Kleppe <tore.kleppe@uis.no>

**Depends** MASS, foreach, matrixStats, ggplot2

**Description** Computational routines for estimating local Gaussian parameters. Local Gaussian parameters are useful for characterizing and testing for non-linear dependence within bivariate data. See e.g. Tjostheim and Hufthammer, Local Gaussian correlation: A new measure of dependence, Journal of Econometrics, 2013, Volume 172 (1), pages 33-48 <DOI:10.1016/j.jeconom.2012.08.001>.

**License** GPL-2

**LazyLoad** yes

**RoxygenNote** 7.1.1

**NeedsCompilation** yes

**Repository** CRAN

**Date/Publication** 2021-10-06 14:00:02 UTC

<code>localgauss</code>	<i>local Gaussian parameters</i>
-------------------------	----------------------------------

## Description

Routine for estimating local Gaussian parameters based on a sample from the bivariate distribution under consideration. The routine can either estimate local parameters on a grid covering the data controlled by the gsize and hthresh parameters. Otherwise, local Gaussian parameters can be estimated at coordinates specified by the user in `xy.mat`.

## Usage

```
localgauss(x,y,b1=1,b2=1,gsize=15,hthresh=0.001,xy.mat=NULL)
```

## Arguments

<code>x,y</code>	The two data vectors
<code>b1,b2</code>	The bandwidth in the x-direction and y-direction, respectively
<code>gsize</code>	The gridsize (only used if <code>xy.mat</code> is not specified).
<code>hthresh</code>	Gridpoints where a non-parametric density estimate is lower than <code>hthresh</code> are omitted (only used if <code>xy.mat</code> is not specified).
<code>xy.mat</code>	A M times 2 matrix of points where the local parameters are to be estimated.

## Details

The objective function is maximized using a modified Newton method. The user should check whether the field `eflag` in the returned object is zero for all estimates. If not, the optimizer has not converged and the estimates should not be trusted. For more details, see [Reference to article].

## Value

S3 object of type `localgauss` containing the fields:

<code>par.est</code>	M times 5 matrix of parameter estimates, with columns mu1,mu2,sigma1,sigma2,rho.
<code>eflag</code>	M-vector of exitflags from the optimizer. Estimations with exit flags other than 0 should not be trusted.
<code>hessian</code>	The negative Hessian of the objective function.

O., Local Gaussian correlation: A new measure of dependence, Journal of Econometrics, 172(1), pages 33-48, 2013, for a detailed description of local Gaussian correlation.

**See Also**

[localgauss.indtest](#).

**Examples**

```
x=rnorm(n=1000)
y=x^2 + rnorm(n=1000)
lgobj = localgauss(x,y)
```

<b>localgauss.indtest</b>	<i>Pointwise Independence test based on local Gaussian correlation</i>
---------------------------	--

**Description**

Routine for testing for local independence based on local Gaussian parameters. It accepts an S3 object produced by `localgauss()`, and performs a bootstrap-based test with null-hypothesis being that `x` and `y` are independent.

**Usage**

```
localgauss.indtest(locobj,R=10,alpha=0.10,seed=1)
```

**Arguments**

<code>locobj</code>	localgauss-object
<code>R</code>	Number of bootstrap replica
<code>alpha</code>	significance level (note: two sided test)
<code>seed</code>	Random seed in used for bootstrap

**Details**

The test is based on producing a null-distribution of local Gaussian correlations where the original data are resampled from their empirical marginal distributions. The bootstrap-based null-distribution is produced for each point specified in `xy.mat` in `locobj`. An estimated local correlation for the original data significantly larger than the null-distribution is indicated with `+1` (returned in the vector `test.results`). An estimated local correlation for the original data insignificant with respect to the null-distribution is indicated with `0`. An estimated local correlation for the original data significantly smaller than the null-distribution is indicated with `-1`.

**Value**

S3 object of type `localgauss.indtest` containing the fields:

<code>localgauss</code>	simply returns <code>locobj</code> .
<code>upper</code>	Vector containing the $1-\alpha/2$ quantiles of the null-distributions.
<code>lower</code>	Vector containing the $\alpha/2$ quantiles of the null-distributions.
<code>test.results</code>	Vector containing the test results.

## Examples

```
x=rnorm(n=100)
y=x^2 + rnorm(n=100)
lgobj = localgauss(x,y,gsize=8)
lgind = localgauss.indtest(lgobj)
```

**plot.localgauss**      *Local Gaussian correlation plot*

## Description

Plots estimates of local Gaussian correlation.

## Usage

```
## S3 method for class 'localgauss'
plot(x,...,plot.text=TRUE,plot.points=FALSE,tsize=3,
      lowcol="cyan",highcol="magenta",point.col="black",
      point.size=NULL,xlab="",ylab","",divergent.col.grad=T)
```

## Arguments

- |                    |  |
|--------------------|--|
| <b>x</b>           | S3 object of class "localgauss" produced by the localgauss-function                      |
| <b>...</b>         | Not used.  |
| <b>plot.text</b>   | If TRUE, the numerical values of the estimated local correlation are added to each tile. |
| <b>plot.points</b> | If TRUE, the original observations are overlain.   |
| <b>tsize</b>       | The font size used if plot.text is TRUE  |

lowcol	The color used to indicate negative correlation of -1
highcol	The color used to indicate positive correlation of 1
point.col	The colour used for observations points if plot.points is TRUE.
point.size	The size of observations points if plot.points is TRUE.
xlab,ylab	The label of x-axis and y-axis, respectively.
divergent.col.grad	If TRUE, a divergent color gradient between lowcol and highcol with 0 as mid-point is used. If FALSE a ordinary color gradient between lowcol and highcol is used.
