

# Package ‘reformulas’

May 1, 2025

**Title** Machinery for Processing Random Effect Formulas

**Version** 0.4.1

**Description** Takes formulas including random-effects components (formatted as in 'lme4', 'glmmTMB', etc.) and processes them. Includes various helper functions.

**URL** <https://github.com/bbolker/reformulas>

**License** GPL-3

**Encoding** UTF-8

**Imports** stats, methods, Matrix, Rdpack

**RdMacros** Rdpack

**Suggests** lme4, tinytest, glmmTMB

**RoxygenNote** 7.3.2.9000

**NeedsCompilation** no

**Author** Ben Bolker [aut, cre] (ORCID: <<https://orcid.org/0000-0002-2127-0443>>)

**Maintainer** Ben Bolker <bolker@mcmaster.ca>

**Repository** CRAN

**Date/Publication** 2025-04-30 22:10:02 UTC

anySpecial	<i>Detect whether there are any 'specials' in a formula term</i>
------------	--

---

### Description

Detect whether there are any 'specials' in a formula term

### Usage

```
anySpecial(term, specials = findReTrmClasses(), fast = FALSE)
```

### Arguments

term	formula term
specials	values to detect
fast	(logical) use quick (syntactic) test for presence of specials?

### Value

logical value

### Examples

```
## should only detect s as the head of a function, s(...)
anySpecial(~diag(1))
anySpecial(~diag)
anySpecial(~diag[[1]])
anySpecial(~diag[1])
anySpecial(~s)
anySpecial(~s(hello+goodbye,whatever))
```

---

expandDoubleVerts	<i>Expand terms with '   ' notation into separate '   ' terms</i>
-------------------	---

---

### Description

From the right hand side of a formula for a mixed-effects model, expand terms with the double vertical bar operator into separate, independent random effect terms.

### Usage

```
expandDoubleVerts(term)
```

### Arguments

term	a mixed-model formula
------	-----------------------

**Value**

the modified term

**See Also**

[formula](#), [model.frame](#), [model.matrix](#).  
Other utilities: [mkReTrms\(\)](#), [nobars\(\)](#), [subbars\(\)](#)

---

expandGrpVar	<i>apply</i>
--------------	--------------

---

**Description**

apply

**Usage**

expandGrpVar(f)

**Arguments**

f                    a language object (an atom of a formula) `expandGrpVar(quote(x*y))` `expandGrpVar(quote(x/y))`

---

findReTrmClasses	<i>list of specials – taken from enum.R</i>
------------------	---

---

**Description**

list of specials – taken from enum.R

**Usage**

findReTrmClasses()

---

isNested	<i>Is f1 nested within f2?</i>
----------	--------------------------------

---

### Description

Does every level of f1 occur in conjunction with exactly one level of f2? The function is based on converting a triplet sparse matrix to a compressed column-oriented form in which the nesting can be quickly evaluated.

### Usage

```
isNested(f1, f2)
```

### Arguments

f1	factor 1
f2	factor 2

### Value

TRUE if factor 1 is nested within factor 2

### Examples

```
if (requireNamespace("lme4")) {
  data("Pastes", package = "lme4")
  with(Pastes, isNested(cask, batch)) ## => FALSE
  with(Pastes, isNested(sample, batch)) ## => TRUE
}
```

---

mkReTrms	<i>Create list of structures needed for models with random effects</i>
----------	--

---

### Description

From the result of [findbars](#) applied to a model formula and the evaluation frame, create the model matrix, etc. associated with random-effects terms. See the description of the returned value for a detailed list.

**Usage**

```
mkReTrms(
  bars,
  fr,
  drop.unused.levels = TRUE,
  reorder.terms = TRUE,
  reorder.vars = FALSE,
  calc.lammdat = TRUE,
  sparse = NULL
)
```

**Arguments**

<code>bars</code>	a list of parsed random-effects terms
<code>fr</code>	a model frame in which to evaluate these terms
<code>drop.unused.levels</code>	(logical) drop unused factor levels?
<code>reorder.terms</code>	arrange random effects terms in decreasing order of number of groups (factor levels)?
<code>reorder.vars</code>	arrange columns of individual random effects terms in alphabetical order?
<code>calc.lammdat</code>	(logical) compute <code>Lammdat</code> and <code>Lind</code> components? (At present these components are needed for <code>lme4</code> machinery but not for <code>glmmTMB</code> , and may be large in some cases; see Bates <i>et al.</i> 2015)
<code>sparse</code>	(logical) set up sparse model matrices?

**Value**

	a list with components
<code>Zt</code>	transpose of the sparse model matrix for the random effects
<code>Ztlist</code>	list of components of the transpose of the random-effects model matrix, separated by random-effects term
<code>Lammdat</code>	transpose of the sparse relative covariance factor
<code>Lind</code>	an integer vector of indices determining the mapping of the elements of the <code>theta</code> to the "x" slot of <code>Lammdat</code>
<code>theta</code>	initial values of the covariance parameters
<code>lower</code>	lower bounds on the covariance parameters
<code>flist</code>	list of grouping factors used in the random-effects terms
<code>cnms</code>	a list of column names of the random effects according to the grouping factors
<code>Gp</code>	a vector indexing the association of elements of the conditional mode vector with random-effect terms; if <code>nb</code> is the vector of numbers of conditional modes per term (i.e. number of groups times number of effects per group), <code>Gp</code> is <code>c(0, cumsum(nb))</code> (and conversely <code>nb</code> is <code>diff(Gp)</code> )
<code>nl</code>	names of the terms (in the same order as <code>Zt</code> , i.e. reflecting the <code>reorder.terms</code> argument)

## See Also

Other utilities: [expandDoubleVerts\(\)](#), [nobars\(\)](#), [subbars\(\)](#)

---

nobars

*Omit terms separated by vertical bars in a formula*

---

## Description

Remove the random-effects terms from a mixed-effects formula, thereby producing the fixed-effects formula.

## Usage

```
nobars(term)
```

```
nobars_(term)
```

## Arguments

term                      the right-hand side of a mixed-model formula

## Value

the fixed-effects part of the formula

## Note

This function is called recursively on individual terms in the model, which is why the argument is called `term` and not a name like `form`, indicating a formula.

## See Also

[formula](#), [model.frame](#), [model.matrix](#).

Other utilities: [expandDoubleVerts\(\)](#), [mkReTrms\(\)](#), [subbars\(\)](#)

## Examples

```
nobars(Reaction ~ Days + (Days|Subject)) ## => Reaction ~ Days
```

---

no_specials	<i>Drop 'specials' from a formula</i>
-------------	---------------------------------------

---

**Description**

Drop 'specials' from a formula

**Usage**

```
no_specials(term, specials = c("|", "||", "s"))
```

**Arguments**

term	a term or formula or list thereof
specials	function types to drop

**Value**

a call or language object (or list) with specials removed

**Examples**

```
no_specials(findbars_x(~ 1 + s(x) + (f|g) + diag(x|y)))
no_specials(~us(f|g))
```

---

RHSForm	<i>extract right-hand side of a formula</i>
---------	---

---

**Description**

extract right-hand side of a formula

**Usage**

```
RHSForm(form, as.form = FALSE)
```

**Arguments**

form	a formula object
as.form	(logical) return a formula (TRUE) or as a call/symbolic object (FALSE) ?

**Value**

a language object

**Examples**

```
RHSForm(y ~ x + (1|g))
```

---

`subbars`*"Substitute bars"*

---

**Description**

Substitute the '+' function for the '|' and '||' function in a mixed-model formula. This provides a formula suitable for the `current.model.frame` function.

**Usage**

```
subbars(term)
```

**Arguments**

<code>term</code>	a mixed-model formula
-------------------	-----------------------

**Value**

the formula with all | and || operators replaced by +

**Note**

This function is called recursively on individual terms in the model, which is why the argument is called `term` and not a name like `form`, indicating a formula.

**See Also**

[formula](#), [model.frame](#), [model.matrix](#).

Other utilities: [expandDoubleVerts\(\)](#), [mkReTrms\(\)](#), [nobars\(\)](#)

**Examples**

```
subbars(Reaction ~ Days + (Days|Subject)) ## => Reaction ~ Days + (Days + Subject)
```
