

Package ‘rvec’

July 13, 2025

Type Package

Title Vectors Representing Random Variables

Version 0.0.8

Description Random vectors, called rvecs. An rvec holds multiple draws, but tries to behave like a standard R vector, including working well in data frames. Rvecs are useful for analysing output from a simulation or a Bayesian analysis.

rvec-package

Package 'rvec'

Description

Tools for working with random draws from a distribution, eg draws from a posterior distribution in a Bayesian analysis.

Details

An rvec holds multiple draws, but wherever possible behaves like an ordinary R vector. For instance, if `x` is an rvec holding 1000 draws from a distribution, then `2 * x` returns a new rvec where each draw has been multiplied by 2.

To summarise across draws, use a function starting with `draws`. For instance, to calculate a credible interval, use `draws_ci()`.

Functions

Creating rvecs

- `rvec()` Class depends on input
- `rvec_dbl()` Doubles
- `rvec_int()` Integers
- `rvec_lgl()` Logical
- `rvec_chr()` Character
- `collapse_to_rvec()` Data in data frame
- `new_rvec()` Blanks

Manipulating rvecs

- `if_else_rvec()` `if_else()` where condition is rvec
- `map_rvec()` `map()` for rvecs
- `extract_draw()` Single draw from rvec

Probability distributions

- `dbeta_rvec()` Beta
- `dbinom_rvec()` Binomial
- `dcauchy_rvec()` Cauchy
- `dchisq_rvec()` Chi-square
- `dexp_rvec()` Exponential
- `df_rvec()` F
- `dgamma_rvec()` Gamma
- `dgeom_rvec()` Geometric

- `dhyper_rvec()` Hypergeometric
- `dlnorm_rvec()` Lognormal
- `dmultinom()` Multinomial
- `dnbinom_rvec()` Negative binomial
- `dnorm_rvec()` Normal
- `dpois_rvec()` Poisson
- `dt_rvec()` Student's T
- `dunif_rvec()` Uniform
- `dweibull_rvec()` Weibull

Summarizing across draws

- `draws_all()` All draws
- `draws_any()` Any draws
- `draws_min()` Minimum draw
- `draws_max()` Maximum draw
- `draws_median()` Median draw
- `draws_mean()` Mean draw
- `draws_mode()` Modal draw
- `draws_ci()` Credible intervals
- `draws_quantile()` Quantiles
- `draws_fun()` Arbitrary function
- `n_draw()` Number of draws

Coercion, classes

- `as_list_col()` Rvec or matrix to list
- `expand_from_rvec()` Inverse of `collapse_to_rvec()`
- `is_rvec()` Object an rvec?

Weighted summaries

- `weighted_mad()` Weighted mean absolute deviation
- `weighted_mean()` Weighted mean
- `weighted_median()` Weighted median
- `weighted_sd()` Weighted standard deviation
- `weighted_var()` Weighted variances

Datasets

- `divorce()` Divorce rates
- `reg_post()` Regression coefficients

Packages with similar functionality

- [rv](#)
- [posterior](#)

as_list_col

Convert to List Column

Description

Convert an [rvec](#) or matrix to a list that can be used as a list column in a data frame.

Usage

```
as_list_col(x)

## S3 method for class 'rvec'
as_list_col(x)

## S3 method for class 'matrix'
as_list_col(x)
```

Arguments

x An [rvecs](#) or matrix.

Value

A list:

- If x is an [rvec](#), then the list contains `length(x)` vectors, each of which has `n_draw(x)` elements.
- If x is a matrix, then the list contains `nrow(x)` vectors, each of which has `ncol(x)` elements.

See Also

- `rvec()` to construct an rvec.
- `expand_from_rvec()` to convert a data frame from using rvecs to using draw and value columns.
- `as_rvar???`
- converting rvecs to
- Functions for summarising and plotting distributions in package `ggdist` understand list columns.

Examples

```
l <- list(1:3,
          4:6)
r <- rvec(l)
as_list_col(r)
```

collapse_to_rvec

Convert a Data Frame Between 'Database' and 'Rvec' Formats

Description

`collapse_to_rvec()` converts a data frame from a 'database' format to an 'rvec' format. `expand_from_rvec()`, does the opposite, converting a data frame from an rvecs format to a database format.

Usage

```
collapse_to_rvec(data, draw = draw, values = value, by = NULL, type = NULL)

## S3 method for class 'data.frame'
collapse_to_rvec(data, draw = draw, values = value, by = NULL, type = NULL)

## S3 method for class 'grouped_df'
collapse_to_rvec(data, draw = draw, values = value, by = NULL, type = NULL)

expand_from_rvec(data, draw = "draw")

## S3 method for class 'data.frame'
expand_from_rvec(data, draw = "draw")

## S3 method for class 'grouped_df'
expand_from_rvec(data, draw = "draw")
```

Arguments

data	A data frame, possibly grouped .
draw	<tidyselect> The variable that uniquely identifies random draws within each combination of values for the 'by' variables. Must be quoted for <code>expand_from_rvec()</code> .
values	<tidyselect> One or more variables in data that hold measurements.
by	<tidyselect> Variables used to stratify or cross-classify the data. See Details.
type	String specifying the class of rvec to use for each variable. Optional. See Details.

Details

In database format, each row represents one random draw. The data frame contains a 'draw' variable that distinguishes different draws within the same combination of 'by' variables. In rvec format, each row represents one combination of 'by' variables, and multiple draws are stored in an **rvec**. See below for examples.

Value

A data frame.

- `collapse_to_rvec()` **reduces** the number of rows by a factor of `n_draw()`.
- `expand_from_rvec()` **increases** the number of rows by a factor of `n_draw()`.
- `collapse_to_rvec()` silently drops all variables that are not draw, value or grouping variables if data is a **grouped** data frame.

by argument

The by argument is used to specify stratifying variables. For instance if by includes sex and age, then data frame produced by `collapse_to_rvec()` has separate rows for each combination of sex and age.

If data is a **grouped** data frame, then the grouping variables take precedence over by.

If no value for by is provided, and data is not a grouped data frame, then `collapse_to_rvec()` assumes that all variables in data that are not included in value and draw should be included in by.

type argument

By default, `collapse_to_rvec()` calls function `rvec()` on each values variable in data. `rvec()` chooses the class of the output (ie `rvec_chr`, `rvec_dbl`, `rvec_int`, or `rvec_lgl`) depending on the input. Types can instead be specified in advance, using the type argument. type is a string, each character of which specifies the class of the corresponding values variable. The characters have the following meanings:

- "c": `rvec_chr`
- "d": `rvec_dbl`
- "i": `rvec_int`
- "l": `rvec_lgl`

- `"?"`: Depends on inputs.

The codes for type are modified from ones used by the `readr` package.

See Also

- `rvec()` to construct a single rvec.
- `as_list_col()` to convert an rvec to a list variable.
- `dplyr::group_vars()` gives the names of the grouping variables in a grouped data frame.

`collapse_to_rvec()` and `expand_from_rvec()` are analogous to `tidyr::nest()` and `tidyr::unnest()` though `collapse_to_rvec()` and `expand_from_rvec()` move values into and out of rvecs, while `tidyr::nest()` and `tidyr::unnest()` move them in and out of data frames. (`tidyr::nest()` and `tidyr::unnest()` are also a lot more flexible.)

Examples

```
library(dplyr)
data_db <- tribble(
  ~occupation, ~sim, ~pay,
  "Statistician", 1, 100,
  "Statistician", 2, 80,
  "Statistician", 3, 105,
  "Banker", 1, 400,
  "Banker", 2, 350,
  "Banker", 3, 420
)

## database format to rvec format
data_rv <- data_db |>
  collapse_to_rvec(draw = sim,
                   values = pay)
data_rv

## rvec format to database format
data_rv |>
  expand_from_rvec()

## provide a name for the draw variable
data_rv |>
  expand_from_rvec(draw = "sim")

## specify that rvec variable
## must be rvec_int
data_rv <- data_db |>
  collapse_to_rvec(draw = sim,
                   values = pay,
                   type = "i")

## specify stratifying variable explicitly,
## using 'by' argument
data_db |>
```

```

collapse_to_rvec(draw = sim,
                  values = pay,
                  by = occupation)

## specify stratifying variable explicitly,
## using 'group_by'
library(dplyr)
data_db |>
  group_by(occupation) |>
  collapse_to_rvec(draw = sim,
                  values = pay)

```

dbeta_rvec

*The Beta Distribution, Using Multiple Draws***Description**

Density, distribution function, quantile function and random generation for the Beta distribution, modified to work with rvecs.

Usage

```

dbeta_rvec(x, shape1, shape2, ncp = 0, log = FALSE)

pbeta_rvec(q, shape1, shape2, ncp = 0, lower.tail = TRUE, log.p = FALSE)

qbeta_rvec(p, shape1, shape2, ncp = 0, lower.tail = TRUE, log.p = FALSE)

rbeta_rvec(n, shape1, shape2, ncp = 0, n_draw = NULL)

```

Arguments

x	Quantiles. Can be an rvec.
shape1, shape2	Parameters for beta distribution. Non-negative. See stats::dbeta() . Can be an rvecs.
ncp	Non-centrality parameter. Default is 0. Cannot be an rvec.
log, log.p	Whether to return results on a log scale. Default is FALSE. Cannot be an rvec.
q	Quantiles. Can be an rvec.
lower.tail	Whether to return $P[X \leq x]$, as opposed to $P[X > x]$. Default is TRUE. Cannot be an rvec.
p	Probabilities. Can be an rvec.
n	The length of random vector being created. Cannot be an rvec.
n_draw	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `dbeta_rvec()`, `pbeta_rvec()`, `qbeta_rvec()` and `rbeta_rvec()` work like base R functions `dbeta()`, `pbeta()`, `qbeta()`, and `rbeta()`, except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `rbeta_rvec()` also returns an rvec if a value for `n_draw` is supplied.

`dbeta_rvec()`, `pbeta_rvec()`, `qbeta_rvec()` and `rbeta_rvec()` use [tidyverse](#) vector recycling rules:

- Vectors of length 1 are recycled
- All other vectors must have the same size

Value

- If any of the arguments are rvecs, or if a value for `n_draw` is supplied, then an [rvec](#)
- Otherwise an ordinary R vector.

See Also

- [dbeta\(\)](#)
- [pbeta\(\)](#)
- [qbeta\(\)](#)
- [rbeta\(\)](#)
- [stats::distributions](#).

Examples

```
x <- rvec(list(c(0, 0.25),
               c(0.5, 0.99)))
dbeta_rvec(x, shape1 = 1, shape2 = 1)
pbeta_rvec(x, shape1 = 1, shape2 = 1)

rbeta_rvec(n = 2,
           shape = 1:2,
           shape2 = 1,
           n_draw = 1000)
```

Description

Density, distribution function, quantile function and random generation for the binomial distribution, modified to work with rvecs.

Usage

```
dbinom_rvec(x, size, prob, log = FALSE)

pbinom_rvec(q, size, prob, lower.tail = TRUE, log.p = FALSE)

qbinom_rvec(p, size, prob, lower.tail = TRUE, log.p = FALSE)

rbinom_rvec(n, size, prob, n_draw = NULL)
```

Arguments

<code>x</code>	Quantiles. Can be an rvec.
<code>size</code>	Number of trials. See stats::dbinom() . Can be an rvec.
<code>prob</code>	Probability of success in each trial. See stats::dbinom() . Can be an rvec.
<code>log, log.p</code>	Whether to return results on a log scale. Default is FALSE. Cannot be an rvec.
<code>q</code>	Quantiles. Can be an rvec.
<code>lower.tail</code>	Whether to return $P[X \leq x]$, as opposed to $P[X > x]$. Default is TRUE. Cannot be an rvec.
<code>p</code>	Probabilities. Can be an rvec.
<code>n</code>	The length of random vector being created. Cannot be an rvec.
<code>n_draw</code>	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `dbinom_rvec()`, `pbinom_rvec()`, `qbinom_rvec()` and `rbinom_rvec()` work like base R functions [dbinom\(\)](#), [pbinom\(\)](#), [qbinom\(\)](#), and [rbinom\(\)](#), except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `rbinom_rvec()` also returns an rvec if a value for `n_draw` is supplied.

`dbinom_rvec()`, `pbinom_rvec()`, `qbinom_rvec()` and `rbinom_rvec()` use [tidyverse](#) vector recycling rules:

- Vectors of length 1 are recycled
- All other vectors must have the same size

Value

- If any of the arguments are rvecs, or if a value for `n_draw` is supplied, then an [rvec](#)
- Otherwise an ordinary R vector.
- `rbinom_rvec()` always returns doubles (not integers).

Warning

From version rvec version 0.7.4 onwards, `rbinom_rvec()` always returns doubles (not integers).

See Also

- [dbinom\(\)](#)
- [pbinom\(\)](#)
- [qbinom\(\)](#)
- [rbinom\(\)](#)
- [stats::distributions](#).

Examples

```
x <- rvec(list(c(3, 8),
               c(0, 2)))
dbinom_rvec(x, size = 8, prob = 0.3)
pbinom_rvec(x, size = 8, prob = 0.3)

rbinom_rvec(n = 2,
            size = 10,
            prob = c(0.7, 0.3),
            n_draw = 1000)
```

dcauchy_rvec

The Cauchy Distribution, Using Multiple Draws

Description

Density, distribution function, quantile function and random generation for the Cauchy distribution, modified to work with rvecs.

Usage

```
dcauchy_rvec(x, location = 0, scale = 1, log = FALSE)

pcauchy_rvec(q, location = 0, scale = 1, lower.tail = TRUE, log.p = FALSE)

qcauchy_rvec(p, location = 0, scale = 1, lower.tail = TRUE, log.p = FALSE)

rcauchy_rvec(n, location = 0, scale = 1, n_draw = NULL)
```

Arguments

x	Quantiles. Can be an rvec.
location	Center of distribution. Default is 0. See stats::dcauchy() . Can be an rvec.
scale	Scale parameter. Default is 1. See stats::dcauchy() . Can be an rvec.
log, log.p	Whether to return results on a log scale. Default is FALSE. Cannot be an rvec.
q	Quantiles. Can be an rvec.

lower.tail	Whether to return $P[X \leq x]$, as opposed to $P[X > x]$. Default is TRUE. Cannot be an rvec.
p	Probabilities. Can be an rvec.
n	The length of random vector being created. Cannot be an rvec.
n_draw	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `dcauchy_rvec()`, `pcauchy_rvec()`, `pcauchy_rvec()` and `rcauchy_rvec()` work like base R functions `dcauchy()`, `pcauchy()`, `qcauchy()`, and `rcauchy()`, except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `rcauchy_rvec()` also returns an rvec if a value for `n_draw` is supplied.

`dcauchy_rvec()`, `pcauchy_rvec()`, `pcauchy_rvec()` and `rcauchy_rvec()` use [tidyverse](#) vector recycling rules:

- Vectors of length 1 are recycled
- All other vectors must have the same size

Value

- If any of the arguments are rvecs, or if a value for `n_draw` is supplied, then an [rvec](#)
- Otherwise an ordinary R vector.

See Also

- [dcauchy\(\)](#)
- [pcauchy\(\)](#)
- [qcauchy\(\)](#)
- [rcauchy\(\)](#)
- [stats::distributions](#).

Examples

```
x <- rvec(list(c(3, -5.1),
               c(0, -2.3)))
dcauchy_rvec(x)
pcauchy_rvec(x)

rcauchy_rvec(n = 2,
             location = c(-5, 5),
             n_draw = 1000)
```

Description

Density, distribution function, quantile function and random generation for the chi-squared distribution, modified to work with rvecs.

Usage

```
dchisq_rvec(x, df, ncp = 0, log = FALSE)

pchisq_rvec(q, df, ncp = 0, lower.tail = TRUE, log.p = FALSE)

qchisq_rvec(p, df, ncp = 0, lower.tail = TRUE, log.p = FALSE)

rchisq_rvec(n, df, ncp = 0, n_draw = NULL)
```

Arguments

x	Quantiles. Can be an rvec.
df	Degrees of freedom. See stats::dchisq() . Can be an rvec.
ncp	Non-centrality parameter. Default is 0. Cannot be an rvec.
log, log.p	Whether to return results on a log scale. Default is FALSE. Cannot be an rvec.
q	Quantiles. Can be an rvec.
lower.tail	Whether to return $P[X \leq x]$, as opposed to $P[X > x]$. Default is TRUE. Cannot be an rvec.
p	Probabilities. Can be an rvec.
n	The length of random vector being created. Cannot be an rvec.
n_draw	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `dchisq_rvec()`, `pchisq_rvec()`, `qchisq_rvec()` and `rchisq_rvec()` work like base R functions [dchisq\(\)](#), [pchisq\(\)](#), [qchisq\(\)](#), and [rchisq\(\)](#), except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `rchisq_rvec()` also returns an rvec if a value for `n_draw` is supplied.

`dchisq_rvec()`, `pchisq_rvec()`, `qchisq_rvec()` and `rchisq_rvec()` use [tidyverse](#) vector recycling rules:

- Vectors of length 1 are recycled
- All other vectors must have the same size

Value

- If any of the arguments are rvecs, or if a value for `n_draw` is supplied, then an [rvec](#)
- Otherwise an ordinary R vector.

See Also

- [dchisq\(\)](#)
- [pchisq\(\)](#)
- [qchisq\(\)](#)
- [rchisq\(\)](#)
- [stats::distributions](#).

Examples

```
x <- rvec(list(c(3, 5.1),
               c(0.1, 2.3)))
dchisq_rvec(x, df = 3)
pchisq_rvec(x, df = 3)

rchisq_rvec(n = 2,
            df = 3:4,
            n_draw = 1000)
```

`dexp_rvec`*The Exponential Distribution, Using Multiple Draws*

Description

Density, distribution function, quantile function and random generation for the exponential distribution, modified to work with rvecs.

Usage

```
dexp_rvec(x, rate = 1, log = FALSE)

pexp_rvec(q, rate = 1, lower.tail = TRUE, log.p = FALSE)

qexp_rvec(p, rate = 1, lower.tail = TRUE, log.p = FALSE)

rexp_rvec(n, rate = 1, n_draw = NULL)
```

Arguments

<code>x</code>	Quantiles. Can be an rvec.
<code>rate</code>	Vector of rates. See stats::dexp() . Can be an rvec.
<code>log, log.p</code>	Whether to return results on a log scale. Default is FALSE. Cannot be an rvec.
<code>q</code>	Quantiles. Can be an rvec.
<code>lower.tail</code>	Whether to return $P[X \leq x]$, as opposed to $P[X > x]$. Default is TRUE. Cannot be an rvec.
<code>p</code>	Probabilities. Can be an rvec.
<code>n</code>	The length of random vector being created. Cannot be an rvec.
<code>n_draw</code>	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `dexp_rvec()`, `pexp_rvec()`, `qexp_rvec()` and `rexp_rvec()` work like base R functions [dexp\(\)](#), [pexp\(\)](#), [qexp\(\)](#), and [rexp\(\)](#), except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `rexp_rvec()` also returns an rvec if a value for `n_draw` is supplied.

`dexp_rvec()`, `pexp_rvec()`, `qexp_rvec()` and `rexp_rvec()` use [tidyverse](#) vector recycling rules:

- Vectors of length 1 are recycled
- All other vectors must have the same size

Value

- If any of the arguments are rvecs, or if a value for `n_draw` is supplied, then an [rvec](#)
- Otherwise an ordinary R vector.

See Also

- [dexp\(\)](#)
- [pexp\(\)](#)
- [qexp\(\)](#)
- [rexp\(\)](#)
- [stats::distributions](#).

Examples

```
x <- rvec(list(c(3, 5.1),
               c(0.1, 2.3)))
dexp_rvec(x, rate = 1.5)
pexp_rvec(x, rate = 1.5)

rexp_rvec(n = 2,
          rate = c(1.5, 4),
          n_draw = 1000)
```

Description

Density, distribution function, quantile function and random generation for the F distribution, modified to work with rvecs.

Usage

```
df_rvec(x, df1, df2, ncp = 0, log = FALSE)
```

```
pf_rvec(q, df1, df2, ncp = 0, lower.tail = TRUE, log.p = FALSE)
```

```
qf_rvec(p, df1, df2, ncp = 0, lower.tail = TRUE, log.p = FALSE)
```

```
rf_rvec(n, df1, df2, ncp = 0, n_draw = NULL)
```

Arguments

x	Quantiles. Can be an rvec.
df1, df2	Degrees of freedom. See stats::df() . Can be rvecs.
ncp	Non-centrality parameter. Default is 0. Cannot be an rvec.
log, log.p	Whether to return results on a log scale. Default is FALSE. Cannot be an rvec.
q	Quantiles. Can be an rvec.
lower.tail	Whether to return $P[X \leq x]$, as opposed to $P[X > x]$. Default is TRUE. Cannot be an rvec.
p	Probabilities. Can be an rvec.
n	The length of random vector being created. Cannot be an rvec.
n_draw	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `df_rvec()`, `pf_rvec()`, `qf_rvec()` and `rf_rvec()` work like base R functions [df\(\)](#), [pf\(\)](#), [qf\(\)](#), and [rf\(\)](#), except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `rf_rvec()` also returns an rvec if a value for `n_draw` is supplied.

`df_rvec()`, `pf_rvec()`, `qf_rvec()` and `rf_rvec()` use [tidyverse](#) vector recycling rules:

- Vectors of length 1 are recycled
- All other vectors must have the same size

Value

- If any of the arguments are rvecs, or if a value for `n_draw` is supplied, then an [rvec](#)
- Otherwise an ordinary R vector.

See Also

- [df\(\)](#)
- [pf\(\)](#)
- [qf\(\)](#)
- [rf\(\)](#)
- [stats::distributions.](#)

Examples

```
x <- rvec(list(c(3, 5.1),
               c(0.1, 2.3)))
df_rvec(x, df1 = 1, df2 = 3)
pf_rvec(x, df1 = 1, df2 = 3)

rf_rvec(n = 2, df1 = 1, df2 = 2:3, n_draw = 1000)
```

dgamma_rvec

The Gamma Distribution, Using Multiple Draws

Description

Density, distribution function, quantile function and random generation for the gamma distribution, modified to work with rvecs.

Usage

```
dgamma_rvec(x, shape, rate = 1, scale = 1/rate, log = FALSE)

pgamma_rvec(
  q,
  shape,
  rate = 1,
  scale = 1/rate,
  lower.tail = TRUE,
  log.p = FALSE
)

qgamma_rvec(
  p,
  shape,
  rate = 1,
  scale = 1/rate,
  lower.tail = TRUE,
  log.p = FALSE
)

rgamma_rvec(n, shape, rate = 1, scale = 1/rate, n_draw = NULL)
```

Arguments

x	Quantiles. Can be an rvec.
shape	Shape parameter. See stats::dgamma() . Can be an rvec.
rate	Rate parameter. See stats::dgamma() . Can be an rvec.
scale	Scale parameter. An alternative to rate. See stats::dgamma() . Can be an rvec.
log, log.p	Whether to return results on a log scale. Default is FALSE. Cannot be an rvec.
q	Quantiles. Can be an rvec.
lower.tail	Whether to return $P[X \leq x]$, as opposed to $P[X > x]$. Default is TRUE. Cannot be an rvec.
p	Probabilities. Can be an rvec.
n	The length of random vector being created. Cannot be an rvec.
n_draw	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `dgamma_rvec()`, `pgamma_rvec()`, `qgamma_rvec()` and `rgamma_rvec()` work like base R functions [dgamma\(\)](#), [pgamma\(\)](#), [qgamma\(\)](#), and [rgamma\(\)](#), except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `rgamma_rvec()` also returns an rvec if a value for `n_draw` is supplied.

`dgamma_rvec()`, `pgamma_rvec()`, `qgamma_rvec()` and `rgamma_rvec()` use [tidyverse](#) vector recycling rules:

- Vectors of length 1 are recycled
- All other vectors must have the same size

Value

- If any of the arguments are rvecs, or if a value for `n_draw` is supplied, then an [rvec](#)
- Otherwise an ordinary R vector.

See Also

- [dgamma\(\)](#)
- [pgamma\(\)](#)
- [qgamma\(\)](#)
- [rgamma\(\)](#)
- [stats::distributions](#).

Examples

```
x <- rvec(list(c(3, 5.1),
               c(0.1, 2.3)))
dgamma_rvec(x, shape = 1)
pgamma_rvec(x, shape = 1)

rgamma_rvec(n = 2,
            shape = 1,
            rate = c(0.5, 1),
            n_draw = 1000)
```

dgeom_rvec

*The Geometric Distribution, Using Multiple Draws***Description**

Density, distribution function, quantile function and random generation for the geometric distribution, modified to work with rvecs.

Usage

```
dgeom_rvec(x, prob, log = FALSE)

pgeom_rvec(q, prob, lower.tail = TRUE, log.p = FALSE)

qgeom_rvec(p, prob, lower.tail = TRUE, log.p = FALSE)

rgeom_rvec(n, prob, n_draw = NULL)
```

Arguments

x	Quantiles. Can be an rvec.
prob	Probability of success in each trial. See stats::dgeom() . Can be an rvec.
log, log.p	Whether to return results on a log scale. Default is FALSE. Cannot be an rvec.
q	Quantiles. Can be an rvec.
lower.tail	Whether to return $P[X \leq x]$, as opposed to $P[X > x]$. Default is TRUE. Cannot be an rvec.
p	Probabilities. Can be an rvec.
n	The length of random vector being created. Cannot be an rvec.
n_draw	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `dgeom_rvec()`, `pgeom_rvec()`, `qgeom_rvec()` and `rgeom_rvec()` work like base R functions `dgeom()`, `pgeom()`, `qgeom()`, and `rgeom()`, except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `rgeom_rvec()` also returns an rvec if a value for `n_draw` is supplied.

`dgeom_rvec()`, `pgeom_rvec()`, `qgeom_rvec()` and `rgeom_rvec()` use [tidyverse](#) vector recycling rules:

- Vectors of length 1 are recycled
- All other vectors must have the same size

Value

- If any of the arguments are rvecs, or if a value for `n_draw` is supplied, then an [rvec](#)
- Otherwise an ordinary R vector.
- `rgeom_rvec()` always returns doubles (not integers).

Warning

From version rvec version 0.7.4 onwards, `rgeom_rvec()` always returns doubles (not integers).

See Also

- [dgeom\(\)](#)
- [pgeom\(\)](#)
- [qgeom\(\)](#)
- [rgeom\(\)](#)
- [stats::distributions](#).

Examples

```
x <- rvec(list(c(3, 5),
               c(0, 2)))
dgeom_rvec(x, prob = 0.3)
pgeom_rvec(x, prob = 0.3)

rgeom_rvec(n = 2,
           prob = c(0.5, 0.8),
           n_draw = 1000)
```

Description

Density, distribution function, quantile function and random generation for the hypergeometric distribution, modified to work with rvecs.

Usage

```
dhyper_rvec(x, m, n, k, log = FALSE)

phyper_rvec(q, m, n, k, lower.tail = TRUE, log.p = FALSE)

qhyper_rvec(p, m, n, k, lower.tail = TRUE, log.p = FALSE)

rhyper_rvec(nn, m, n, k, n_draw = NULL)
```

Arguments

x	Quantiles. Can be an rvec.
m	Number of white balls in the urn. See stats::dhyper() . Can be an rvec.
n	Number of black balls in the urn. See stats::rhyper() . Can be an rvec.
k	Number of balls drawn from urn. See stats::dhyper() . Can be an rvec.
log, log.p	Whether to return results on a log scale. Default is FALSE. Cannot be an rvec.
q	Quantiles. Can be an rvec.
lower.tail	Whether to return $P[X \leq x]$, as opposed to $P[X > x]$. Default is TRUE. Cannot be an rvec.
p	Probabilities. Can be an rvec.
nn	The length of the random vector being created. The equivalent of n in other random variate functions. See stats::rhyper() . Cannot be an rvec.
n_draw	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `dhyper_rvec()`, `phyper_rvec()`, `qhyper_rvec()` and `rhyper_rvec()` work like base R functions [dhyper\(\)](#), [phyper\(\)](#), [qhyper\(\)](#), and [rhyper\(\)](#), except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `rhyper_rvec()` also returns an rvec if a value for `n_draw` is supplied.

`dhyper_rvec()`, `phyper_rvec()`, `qhyper_rvec()` and `rhyper_rvec()` use [tidyverse](#) vector recycling rules:

- Vectors of length 1 are recycled
- All other vectors must have the same size

Value

- If any of the arguments are rvecs, or if a value for `n_draw` is supplied, then an [rvec](#)
- Otherwise an ordinary R vector.
- `rhyper_rvec()` always returns doubles (not integers).

Warning

From version `rvec` version 0.7.4 onwards, `rhyper_rvec()` always returns doubles (not integers).

See Also

- [dhyper\(\)](#)
- [phyper\(\)](#)
- [qhyper\(\)](#)
- [rhyper\(\)](#)
- [stats::distributions](#).

Examples

```
x <- rvec(list(c(3, 5),
               c(0, 2)))
dhyper_rvec(x, m = 6, n = 6, k = 5)
phyper_rvec(x, m = 6, n = 6, k = 5)

rhyper_rvec(nn = 2,
            k = c(3, 5),
            m = 6,
            n = 6,
            n_draw = 1000)
```

divorce

*Divorce Rates in New Zealand***Description**

Posterior sample from a model of divorce rates in New Zealand.

Usage

```
divorce
```

Format

A tibble with 30,000 rows and the following variables:

- `age`: Age, in 5-year age groups, 15-19 to 65+.
- `sex`: "Female" or "Male".
- `draw`: Index for random draw.
- `rate`: Divorce rate, per 1000.

Source

Derived from data in tables "Age at divorces by sex (marriages and civil unions) (Annual-Dec)" and "Estimated Resident Population by Age and Sex (1991+) (Annual-Dec)" in the online database Infoshare on the Statistics New Zealand website, downloaded on 22 March 2023.

dlnorm_rvec

The Log-Normal Distribution, Using Multiple Draws

Description

Density, distribution function, quantile function and random generation for the log-normal distribution, modified to work with rvecs.

Usage

```
dlnorm_rvec(x, meanlog = 0, sdlog = 1, log = FALSE)

plnorm_rvec(q, meanlog = 0, sdlog = 1, lower.tail = TRUE, log.p = FALSE)

qlnorm_rvec(p, meanlog = 0, sdlog = 1, lower.tail = TRUE, log.p = FALSE)

rlnorm_rvec(n, meanlog = 0, sdlog = 1, n_draw = NULL)
```

Arguments

x	Quantiles. Can be an rvec.
meanlog	Mean of distribution, on log scale. Default is 0. See stats::dlnorm() . Can be an rvec.
sdlog	Standard deviation of distribution, on log scale. Default is 1. See stats::dlnorm() . Can be an rvec.
log, log.p	Whether to return results on a log scale. Default is FALSE. Cannot be an rvec.
q	Quantiles. Can be an rvec.
lower.tail	Whether to return $P[X \leq x]$, as opposed to $P[X > x]$. Default is TRUE. Cannot be an rvec.
p	Probabilities. Can be an rvec.
n	The length of random vector being created. Cannot be an rvec.
n_draw	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `dlnorm_rvec()`, `plnorm_rvec()`, `qlnorm_rvec()` and `rlnorm_rvec()` work like base R functions `dlnorm()`, `plnorm()`, `qlnorm()`, and `rlnorm()`, except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `rlnorm_rvec()` also returns an rvec if a value for `n_draw` is supplied.

`dlnorm_rvec()`, `plnorm_rvec()`, `qlnorm_rvec()` and `rlnorm_rvec()` use [tidyverse](#) vector recycling rules:

- Vectors of length 1 are recycled
- All other vectors must have the same size

Value

- If any of the arguments are rvecs, or if a value for `n_draw` is supplied, then an [rvec](#)
- Otherwise an ordinary R vector.

See Also

- [dlnorm\(\)](#)
- [plnorm\(\)](#)
- [qlnorm\(\)](#)
- [rlnorm\(\)](#)
- [stats::distributions](#).

Examples

```
x <- rvec(list(c(3.1, 5.7),
               c(0.2, 2.3)))

dlnorm_rvec(x)
plnorm_rvec(x)

rlnorm_rvec(n = 2,
            meanlog = c(1, 3),
            n_draw = 1000)
```

`dmultinom_rvec`*The Multinomial Distribution, Using Multiple Draws*

Description

Density function random generation for the multinomial distribution, modified to work with rvecs.

Usage

```
dmultinom_rvec(x, size = NULL, prob, log = FALSE)

rmultinom_rvec(n, size, prob, n_draw = NULL)
```

Arguments

x	Quantiles. Can be an rvec.
size	Total number of trials. See <code>stats::dmultinom()</code> . Can be an rvec.
prob	Numeric non-negative vector, giving the probability of each outcome. Internally normalized to sum to 1. See <code>stats::dmultinom()</code> . Can be an rvec.
log	Whether to return $\log(p)$ rather than p . Default is FALSE. Cannot be an rvec.
n	The length of random vector being created. Cannot be an rvec.
n_draw	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `dmultinom_rvec()` and `rmultinom_rvec()` work like base R functions `dmultinom()` and `rmultinom()`, except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `rmultinom_rvec()` also returns an rvec if a value for `n_draw` is supplied.

Like the base R functions `dmultinom()` and `[rmultinom()]`, `dmultinom_rvec()` and `rmultinom_rvec()` do not recycle their arguments.

Value

- `dmultinom()`
 - If any of the arguments are rvecs, or if a value for `n_draw` is supplied, then an [rvec](#)
 - Otherwise an ordinary R vector.
- `rmultinom()`
 - If `n` is 1, an rvec or ordinary R vector.
 - If `n` is greater than 1, a list of rvecs or ordinary R vectors
- `rmultinom_rvec()` always returns doubles (not integers).

Warning

From version rvec version 0.7.4 onwards, `rmultinom_rvec()` always returns doubles (not integers).

See Also

- [dmultinom\(\)](#)
- [rmultinom\(\)](#)
- [stats::distributions](#).

Examples

```
x <- rvec(list(c(1, 4, 0),
               c(1, 0, 0),
               c(1, 0, 0),
               c(1, 0, 4)))
prob <- c(1/4, 1/4, 1/4, 1/4)
```

```
dmultinom_rvec(x = x, prob = prob)
rmultinom_rvec(n = 1,
               size = 100,
               prob = c(0.1, 0.4, 0.2, 0.3),
               n_draw = 1000)
```

dnbinom_rvec

The Negative Binomial Distribution, Using Multiple Draws

Description

Density, distribution function, quantile function and random generation for the negative binomial distribution, modified to work with rvecs.

Usage

```
dnbinom_rvec(x, size, prob, mu, log = FALSE)

pnbinom_rvec(q, size, prob, mu, lower.tail = TRUE, log.p = FALSE)

qnbinom_rvec(p, size, prob, mu, lower.tail = TRUE, log.p = FALSE)

rnbinom_rvec(n, size, prob, mu, n_draw = NULL)
```

Arguments

x	Quantiles. Can be an rvec.
size	Number of trials. See stats::dnbinom() . Can be an rvec.
prob	Probability of success in each trial. See stats::dnbinom() . Can be an rvec.
mu	Mean value. See stats::dnbinom() . Can be an rvec.
log, log.p	Whether to return results on a log scale. Default is FALSE. Cannot be an rvec.
q	Quantiles. Can be an rvec.
lower.tail	Whether to return $P[X \leq x]$, as opposed to $P[X > x]$. Default is TRUE. Cannot be an rvec.
p	Probabilities. Can be an rvec.
n	The length of random vector being created. Cannot be an rvec.
n_draw	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `dnbinom_rvec()`, `pnbinom_rvec()`, `pnbinom_rvec()` and `rnbinom_rvec()` work like base R functions `dnbinom()`, `pnbinom()`, `qnbinom()`, and `rnbinom()`, except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `rnbinom_rvec()` also returns an rvec if a value for `n_draw` is supplied.

`dnbinom_rvec()`, `pnbinom_rvec()`, `pnbinom_rvec()` and `rnbinom_rvec()` use [tidyverse](#) vector recycling rules:

- Vectors of length 1 are recycled
- All other vectors must have the same size

Value

- If any of the arguments are rvecs, or if a value for `n_draw` is supplied, then an [rvec](#)
- Otherwise an ordinary R vector.
- `rnbinom_rvec()` always returns doubles (not integers).

Warning

From version rvec version 0.7.4 onwards, `rnbinom_rvec()` always returns doubles (not integers).

See Also

- [dnbinom\(\)](#)
- [pnbinom\(\)](#)
- [qnbinom\(\)](#)
- [rnbinom\(\)](#)
- [stats::distributions](#).

Examples

```
x <- rvec(list(c(3, 5),
               c(0, 2)))
dnbinom_rvec(x, size = 6, prob = 0.2)
pnbinom_rvec(x, size = 6, prob = 0.2)

rnbinom_rvec(n = 2,
             size = 2,
             mu = c(4, 8),
             n_draw = 1000)
```

Description

Density, distribution function, quantile function and random generation for the normal distribution, modified to work with rvecs.

Usage

```
dnorm_rvec(x, mean = 0, sd = 1, log = FALSE)
```

```
pnorm_rvec(q, mean = 0, sd = 1, lower.tail = TRUE, log.p = FALSE)
```

```
qnorm_rvec(p, mean = 0, sd = 1, lower.tail = TRUE, log.p = FALSE)
```

```
rnorm_rvec(n, mean = 0, sd = 1, n_draw = NULL)
```

Arguments

x	Quantiles. Can be an rvec.
mean	Mean of distribution. Default is 0. See stats::dnorm() . Can be an rvec.
sd	Standard deviation. Default is 1. See stats::dnorm() . Can be an rvec.
log, log.p	Whether to return results on a log scale. Default is FALSE. Cannot be an rvec.
q	Quantiles. Can be an rvec.
lower.tail	Whether to return $P[X \leq x]$, as opposed to $P[X > x]$. Default is TRUE. Cannot be an rvec.
p	Probabilities. Can be an rvec.
n	The length of random vector being created. Cannot be an rvec.
n_draw	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `dnorm_rvec()`, `pnorm_rvec()`, `qnorm_rvec()` and `rnorm_rvec()` work like base R functions [dnorm\(\)](#), [pnorm\(\)](#), [qnorm\(\)](#), and [rnorm\(\)](#), except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `rnorm_rvec()` also returns an rvec if a value for `n_draw` is supplied.

`dnorm_rvec()`, `pnorm_rvec()`, `qnorm_rvec()` and `rnorm_rvec()` use [tidyverse](#) vector recycling rules:

- Vectors of length 1 are recycled
- All other vectors must have the same size

Value

- If any of the arguments are rvecs, or if a value for `n_draw` is supplied, then an [rvec](#)
- Otherwise an ordinary R vector.

See Also

- [dnorm\(\)](#)
- [pnorm\(\)](#)
- [qnorm\(\)](#)
- [rnorm\(\)](#)
- [stats::distributions](#).

Examples

```
x <- rvec(list(c(3.1, -5.4),
               c(0.1, 2.3)))
dnorm_rvec(x)
pnorm_rvec(x)

rnorm_rvec(n = 2,
           mean = c(-3, 3),
           sd = c(2, 4),
           n_draw = 1000)
```

`dpois_rvec`*The Poisson Distribution, Using Multiple Draws*

Description

Density, distribution function, quantile function and random generation for the Poisson distribution, modified to work with rvecs.

Usage

```
dpois_rvec(x, lambda, log = FALSE)

ppois_rvec(q, lambda, lower.tail = TRUE, log.p = FALSE)

qpois_rvec(p, lambda, lower.tail = TRUE, log.p = FALSE)

rpois_rvec(n, lambda, n_draw = NULL)
```

Arguments

x	Quantiles. Can be an rvec.
lambda	Vector of means. See stats::rpois() . Can be an rvec.
log, log.p	Whether to return results on a log scale. Default is FALSE. Cannot be an rvec.
q	Quantiles. Can be an rvec.
lower.tail	Whether to return $P[X \leq x]$, as opposed to $P[X > x]$. Default is TRUE. Cannot be an rvec.
p	Probabilities. Can be an rvec.
n	The length of random vector being created. Cannot be an rvec.
n_draw	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `dpois_rvec()`, `ppois_rvec()`, `qpois_rvec()` and `rpois_rvec()` work like base R functions [dpois\(\)](#), [ppois\(\)](#), [qpois\(\)](#), and [rpois\(\)](#), except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `rpois_rvec()` also returns an rvec if a value for `n_draw` is supplied.

`dpois_rvec()`, `ppois_rvec()`, `qpois_rvec()` and `rpois_rvec()` use [tidyverse](#) vector recycling rules:

- Vectors of length 1 are recycled
- All other vectors must have the same size

Value

- If any of the arguments are rvecs, or if a value for `n_draw` is supplied, then an [rvec](#)
- Otherwise an ordinary R vector.
- `rpois_rvec()` always returns doubles (not integers).

Warning

From version rvec version 0.7.4 onwards, `rpois_rvec()` always returns doubles (not integers).

See Also

- [dpois\(\)](#)
- [ppois\(\)](#)
- [qpois\(\)](#)
- [rpois\(\)](#)
- [stats::distributions](#).

Examples

```
x <- rvec(list(c(3, 5),
               c(1, 2)))
dpois_rvec(x, lambda = 3)
ppois_rvec(x, lambda = 3)

rpois_rvec(n = 2,
           lambda = c(5, 10),
           n_draw = 1000)
```

draws_all

*Logical Operations Across Random Draws***Description**

Apply all or any logical summaries across random draws.

Usage

```
draws_all(x, na_rm = FALSE)

## S3 method for class 'rvec_chr'
draws_all(x, na_rm = FALSE)

## S3 method for class 'rvec'
draws_all(x, na_rm = FALSE)

draws_any(x, na_rm = FALSE)

## S3 method for class 'rvec_chr'
draws_any(x, na_rm = FALSE)

## S3 method for class 'rvec'
draws_any(x, na_rm = FALSE)
```

Arguments

x	An object of class rvec .
na_rm	Whether to remove NAs before calculating summaries. Default is FALSE.

Value

A vector.

See Also

Apply pre-specified functions across draws:

- `draws_min()`
- `draws_max()`
- `draws_median()`
- `draws_mean()`
- `draws_mode()`
- `draws_ci()`
- `draws_quantile()`

Apply arbitrary function across draws:

- `draws_fun()`

For additional functions for summarising random draws, see [tidybayes](#) and [ggdist](#). Function `as_list_col()` converts rvecs into a format that tidybayes and ggdist can work with.

Examples

```
m <- rbind(a = c(TRUE, FALSE, TRUE),
           b = c(TRUE, TRUE, TRUE),
           c = c(FALSE, FALSE, FALSE))
x <- rvec(m)
x
draws_all(x)
draws_any(x)
```

draws_ci

Credible Intervals from Random Draws

Description

Summarise the distribution of random draws in an rvec, using credible intervals.

Usage

```
draws_ci(x, width = 0.95, prefix = NULL, na_rm = FALSE)
```

```
## S3 method for class 'rvec'
```

```
draws_ci(x, width = 0.95, prefix = NULL, na_rm = FALSE)
```

```
## S3 method for class 'rvec_chr'
```

```
draws_ci(x, width = 0.95, prefix = NULL, na_rm = FALSE)
```

Arguments

x	An object of class rvec .
width	Width(s) of credible interval(s). One or more numbers greater than 0 and less than or equal to 1. Default is 0.975.
prefix	String to be added to the names of columns in the result. Defaults to name of x.
na_rm	Whether to remove NAs before calculating summaries. Default is FALSE.

Value

A [tibble](#) with three columns.

Warning

It is tempting to assign the results of a call to `draws_ci()` to a column in a data frame, as in

```
my_df$ci <- draws_ci(my_rvec)
```

However, creating columns in this way can corrupt an ordinary data frames. For safer options, see the examples below.

See Also

[draws_quantile\(\)](#) gives more options for forming quantiles.

Other ways of applying pre-specified functions across draws are:

- [draws_all\(\)](#)
- [draws_any](#)
- [draws_min\(\)](#)
- [draws_max\(\)](#)
- [draws_median\(\)](#)
- [draws_mean\(\)](#)
- [draws_mode\(\)](#)
- [draws_quantile\(\)](#)

Apply arbitrary function across draws:

- [draws_fun\(\)](#)

For additional functions for summarising random draws, see [tidybayes](#) and [ggdist](#). Function [as_list_col\(\)](#) converts rvecs into a format that [tidybayes](#) and [ggdist](#) can work with.

Examples

```

set.seed(0)
m <- rbind(a = rnorm(100, mean = 5, sd = 2),
           b = rnorm(100, mean = -3, sd = 3),
           c = rnorm(100, mean = 0, sd = 20))
x <- rvec(m)
x
draws_ci(x)
draws_ci(x, width = c(0.5, 0.99))
draws_ci(x, prefix = "results")

## results from 'draws_ci'
## assigned to a data frame
library(dplyr)
df <- data.frame(x)

## base R approach
cbind(df, draws_ci(x))

## a tidyverse alternative:
## mutate with no '='
df |> mutate(draws_ci(x))

```

draws_fun

*Apply Summary Function Across Random Draws***Description**

Summarise the distribution of random draws in an `rvec`, using a function.

Usage

```

draws_fun(x, fun, ...)

## S3 method for class 'rvec'
draws_fun(x, fun, ...)

```

Arguments

<code>x</code>	An object of class <code>rvec</code> .
<code>fun</code>	A function.
<code>...</code>	Additional arguments passed to <code>fun</code> .

Value

The results from calls to `fun`, combined using `vctrs::vec_c()`.

See Also

Apply pre-specified functions across draws:

- `draws_all()`
- `draws_any()`
- `draws_ci()`
- `draws_min()`
- `draws_max()`
- `draws_median()`
- `draws_mean()`
- `draws_mode()`
- `draws_quantile()`

Examples

```
set.seed(0)
m <- rbind(a = rnorm(100, mean = 5, sd = 2),
           b = rnorm(100, mean = -3, sd = 3),
           c = rnorm(100, mean = 0, sd = 20))
x <- rvec(m)
x
draws_fun(x, fun = mad)
draws_fun(x, fun = range)
draws_fun(x, weighted.mean, wt = runif(100))
draws_fun(x, function(x) sd(x) / mean(x))
```

draws_median

Medians, Means, and Modes Across Random Draws

Description

Summarise the distribution of random draws in an `rvec`, using means, medians, or modes.

Usage

```
draws_median(x, na_rm = FALSE)

## S3 method for class 'rvec_chr'
draws_median(x, na_rm = FALSE)

## S3 method for class 'rvec'
draws_median(x, na_rm = FALSE)

draws_mean(x, na_rm = FALSE)
```

```
## S3 method for class 'rvec'  
draws_mean(x, na_rm = FALSE)  
  
## S3 method for class 'rvec_chr'  
draws_mean(x, na_rm = FALSE)  
  
draws_mode(x, na_rm = FALSE)  
  
## S3 method for class 'rvec'  
draws_mode(x, na_rm = FALSE)
```

Arguments

x	An object of class rvec .
na_rm	Whether to remove NAs before calculating summaries. Default is FALSE.

Details

When method is "mode", `reduce_rvec()` returns the most common value for each observation. When there is a tie, it returns NA.

Value

A vector.

See Also

Apply pre-specified functions across draws:

- [draws_all\(\)](#)
- [draws_any\(\)](#)
- [draws_min\(\)](#)
- [draws_max\(\)](#)
- [draws_ci\(\)](#)
- [draws_quantile\(\)](#)

Apply arbitrary function across draws:

- [draws_fun\(\)](#)

For additional functions for summarising random draws, see [tidybayes](#) and [ggdist](#). Function [as_list_col\(\)](#) converts rvecs into a format that tidybayes and ggdist can work with.

Examples

```
m <- rbind(a = c(1, 1, 1, 2, 3),  
          b = c(2, 4, 0, 2, 3),  
          c = c(0, 0, 1, 0, 100))  
x <- rvec(m)  
x
```

```
draws_median(x)
draws_mean(x)
draws_mode(x)
```

draws_min

Minima and Maxima Across Random Draws

Description

Apply min or max across random draws.

Usage

```
draws_min(x, na_rm = FALSE)

draws_max(x, na_rm = FALSE)

## S3 method for class 'rvec_chr'
draws_min(x, na_rm = FALSE)

## S3 method for class 'rvec'
draws_min(x, na_rm = FALSE)

## S3 method for class 'rvec_chr'
draws_max(x, na_rm = FALSE)

## S3 method for class 'rvec'
draws_max(x, na_rm = FALSE)
```

Arguments

x	An object of class rvec .
na_rm	Whether to remove NAs before calculating minima and maxima. Default is FALSE.

Value

A vector.

See Also

Apply pre-specified functions across draws:

- [draws_all\(\)](#)
- [draws_any\(\)](#)
- [draws_median\(\)](#)
- [draws_mean\(\)](#)

- [draws_mode\(\)](#)
- [draws_ci\(\)](#)
- [draws_quantile\(\)](#)

Apply arbitrary function across draws:

- [draws_fun\(\)](#)

For additional functions for summarising random draws, see [tidybayes](#) and [ggdist](#). Function [as_list_col\(\)](#) converts rvecs into a format that tidybayes and ggdist can work with.

Examples

```
m <- rbind(a = c(1, -3, 2),
          b = c(Inf, 0, -Inf),
          c = c(0.2, 0.3, 0.1))
x <- rvec(m)
x
draws_min(x)
draws_max(x)
```

draws_quantile

Quantiles Across Random Draws

Description

Summarise the distribution of random draws in an rvec, using quantiles.

Usage

```
draws_quantile(x, probs = c(0.025, 0.25, 0.5, 0.75, 0.975), na_rm = FALSE)

## S3 method for class 'rvec'
draws_quantile(x, probs = c(0.025, 0.25, 0.5, 0.75, 0.975), na_rm = FALSE)

## S3 method for class 'rvec_chr'
draws_quantile(x, probs = c(0.025, 0.25, 0.5, 0.75, 0.975), na_rm = FALSE)
```

Arguments

x	An object of class rvec .
probs	Vector of probabilities.
na_rm	Whether to remove NAs before calculating summaries. Default is FALSE.

Details

The probs argument defaults to c(0.025, 0.25, 0.5, 0.75, 0.975), the values needed for a median, a 50% credible intervals, and a 95% credible interval.

Value

A [tibble](#).

Warning

It is tempting to assign the results of a call to `draws_quantile()` to a column in a data frame, as in `my_df$quantile <- draws_quantile(my_rvec)`

However, creating data frame columns in this way can corrupt data frames. For safer options, see the examples below.

See Also

[draws_ci\(\)](#) creates simple credible intervals.

Other functions for applying pre-specified functions across draws are:

- [draws_all\(\)](#)
- [draws_any\(\)](#)
- [draws_ci\(\)](#)
- [draws_min\(\)](#)
- [draws_max\(\)](#)
- [draws_median\(\)](#)
- [draws_mean\(\)](#)
- [draws_mode\(\)](#)

Apply arbitrary function across draws:

- [draws_fun\(\)](#)

For additional functions for summarising random draws, see [tidybayes](#) and [ggdist](#). Function [as_list_col\(\)](#) converts rvecs into a format that [tidybayes](#) and [ggdist](#) can work with.

Examples

```
set.seed(0)
m <- rbind(a = rnorm(100, mean = 5, sd = 2),
           b = rnorm(100, mean = -3, sd = 3),
           c = rnorm(100, mean = 0, sd = 20))
x <- rvec(m)
x
draws_quantile(x)

## results from 'draws_quantile'
## assigned to a data frame
library(dplyr)
df <- data.frame(x)

## base R approach
cbind(df, draws_quantile(x))
```

```
## a tidyverse alternative:
## mutate with no '='
df |>
  mutate(draws_quantile(x))
```

dt_rvec

Student t Distribution, Using Multiple Draws

Description

Density, distribution function, quantile function and random generation for the t distribution, modified to work with rvecs.

Usage

```
dt_rvec(x, df, ncp = 0, log = FALSE)

pt_rvec(q, df, ncp = 0, lower.tail = TRUE, log.p = FALSE)

qt_rvec(p, df, ncp = 0, lower.tail = TRUE, log.p = FALSE)

rt_rvec(n, df, ncp = 0, n_draw = NULL)
```

Arguments

x	Quantiles. Can be an rvec.
df	Degrees of freedom. See stats::dt() . Can be an rvec.
ncp	Non-centrality parameter. Default is 0. See stats::dt() . Cannot be an rvec.
log, log.p	Whether to return results on a log scale. Default is FALSE. Cannot be an rvec.
q	Quantiles. Can be an rvec.
lower.tail	Whether to return $P[X \leq x]$, as opposed to $P[X > x]$. Default is TRUE. Cannot be an rvec.
p	Probabilities. Can be an rvec.
n	The length of random vector being created. Cannot be an rvec.
n_draw	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `dt_rvec()`, `pt_rvec()`, `qt_rvec()` and `rt_rvec()` work like base R functions [dt\(\)](#), [pt\(\)](#), [qt\(\)](#), and [rt\(\)](#), except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `rt_rvec()` also returns an rvec if a value for `n_draw` is supplied.

`dt_rvec()`, `pt_rvec()`, `qt_rvec()` and `rt_rvec()` use [tidyverse](#) vector recycling rules:

- Vectors of length 1 are recycled
- All other vectors must have the same size

Value

- If any of the arguments are rvecs, or if a value for `n_draw` is supplied, then an [rvec](#)
- Otherwise an ordinary R vector.

See Also

- [dt\(\)](#)
- [pt\(\)](#)
- [qt\(\)](#)
- [rt\(\)](#)
- [stats::distributions](#).

Examples

```
x <- rvec(list(c(-3.2, 5.3),
               c(-1.6, 2)))
dt_rvec(x, df = 4)
pt_rvec(x, df = 4)

rt_rvec(n = 2,
        df = c(3, 5),
        n_draw = 1000)
```

dunif_rvec

Uniform Distribution, Using Multiple Draws

Description

Density, distribution function, quantile function and random generation for the uniform distribution, modified to work with rvecs.

Usage

```
dunif_rvec(x, min = 0, max = 1, log = FALSE)

punif_rvec(q, min = 0, max = 1, lower.tail = TRUE, log.p = FALSE)

qunif_rvec(p, min = 0, max = 1, lower.tail = TRUE, log.p = FALSE)

runif_rvec(n, min = 0, max = 1, n_draw = NULL)
```

Arguments

x	Quantiles. Can be an rvec.
min	Lower limits. Default is 0. See stats::dunif() . Can be an rvec.
max	Upper limited. Default is 1. See stats::dunif() . Can be an rvec.
log, log.p	Whether to return results on a log scale. Default is FALSE. Cannot be an rvec.
q	Quantiles. Can be an rvec.
lower.tail	Whether to return $P[X \leq x]$, as opposed to $P[X > x]$. Default is TRUE. Cannot be an rvec.
p	Probabilities. Can be an rvec.
n	The length of random vector being created. Cannot be an rvec.
n_draw	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `dunif_rvec()`, `punif_rvec()`, `pnif_rvec()` and `runif_rvec()` work like base R functions `dt()`, `pt()`, `qt()`, and `rt()`, except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `runif_rvec()` also returns an rvec if a value for `n_draw` is supplied.

`dunif_rvec()`, `punif_rvec()`, `pnif_rvec()` and `runif_rvec()` use [tidyverse](#) vector recycling rules:

- Vectors of length 1 are recycled
- All other vectors must have the same size

Value

- If any of the arguments are rvecs, or if a value for `n_draw` is supplied, then an [rvec](#)
- Otherwise an ordinary R vector.

See Also

- [dunif\(\)](#)
- [punif\(\)](#)
- [qunif\(\)](#)
- [runif\(\)](#)
- [stats::distributions](#).

Examples

```
x <- rvec(list(c(0.2, 0.5),
               c(0.6, 0.7)))
dunif_rvec(x)
punif_rvec(x)
```

```
runif_rvec(n = 2,
           min = c(0, 0.5),
           n_draw = 1000)
```

dweibull_rvec

Weibull Distribution, Using Multiple Draws

Description

Density, distribution function, quantile function and random generation for the Weibull distribution, modified to work with rvecs.

Usage

```
dweibull_rvec(x, shape, scale = 1, log = FALSE)

pweibull_rvec(q, shape, scale = 1, lower.tail = TRUE, log.p = FALSE)

qweibull_rvec(p, shape, scale = 1, lower.tail = TRUE, log.p = FALSE)

rweibull_rvec(n, shape, scale = 1, n_draw = NULL)
```

Arguments

x	Quantiles. Can be an rvec.
shape	Shape parameter. See stats::dweibull() . Can be an rvec.
scale	Scale parameter. See stats::dweibull() Default is 1. Can be an rvec.
log, log.p	Whether to return results on a log scale. Default is FALSE. Cannot be an rvec.
q	Quantiles. Can be an rvec.
lower.tail	Whether to return $P[X \leq x]$, as opposed to $P[X > x]$. Default is TRUE. Cannot be an rvec.
p	Probabilities. Can be an rvec.
n	The length of random vector being created. Cannot be an rvec.
n_draw	Number of random draws in the random vector being created. Cannot be an rvec.

Details

Functions `dweibull_rvec()`, `pweibull_rvec()`, `qweibull_rvec()` and `rweibull_rvec()` work like base R functions `dt()`, `pt()`, `qt()`, and `rt()`, except that they accept rvecs as inputs. If any input is an rvec, then the output will be too. Function `rweibull_rvec()` also returns an rvec if a value for `n_draw` is supplied.

`dweibull_rvec()`, `pweibull_rvec()`, `qweibull_rvec()` and `rweibull_rvec()` use [tidyverse](#) vector recycling rules:

- Vectors of length 1 are recycled
- All other vectors must have the same size

Value

- If any of the arguments are rvecs, or if a value for n_draw is supplied, then an [rvec](#)
- Otherwise an ordinary R vector.

See Also

- [dweibull\(\)](#)
- [pweibull\(\)](#)
- [qweibull\(\)](#)
- [rweibull\(\)](#)
- [stats::distributions](#).

Examples

```
x <- rvec(list(c(3.2, 4.5),
               c(0.6, 0.7)))
dweibull_rvec(x, shape = 2)
pweibull_rvec(x, shape = 2)

rweibull_rvec(n = 2,
              shape = c(2, 3),
              n_draw = 1000)
```

extract_draw

Extract a Single Draw From an Rvec

Description

Extract a single draw from x. If a value is supplied for i, extract the ith draw; otherwise extract a random draw.

Usage

```
extract_draw(x, i = NULL)
```

Arguments

x	An rvec .
i	Index for the draw to be extracted. A number between 1 and n_draw(x). If no value is supplied, a draw is chosen at random.

Value

A vector, with type

- double, if x has class "rvec_dbl",
- integer, if x has class "rvec_int",
- character, if x has class "rvec_chr",
- logical, if x has class "rvec_lgl".

See Also

`n_draw()` Number of draws

Examples

```
x <- rvec(matrix(1:50, ncol = 5))
extract_draw(x, i = 1)
extract_draw(x)
```

if_else_rvec

Vectorised If-Else, When Condition is an Rvec

Description

A version of `if_else` for the situation where condition is an rvec.

Usage

```
if_else_rvec(condition, true, false, missing = NULL, size = NULL)
```

Arguments

condition	An object of class <code>rvec_lgl</code> .
true, false	Vectors (including rvecs) to use for TRUE and FALSE values of condition.
missing	Vectors to use for NA values of condition. Optional.
size	Length of output. Optional.

Value

An rvec with the same number of `draws` as condition.

See Also

- base R function `ifelse()` does not work correctly if any of the inputs are rvecs.
- **dplyr** function `if_else` works correctly if arguments true, false or missing are rvecs, but not if argument condition is an rvec.

Examples

```
x <- rvec(list(c(1, 11),
               c(2, 5),
               c(22, 6)))

x > 10 ## rvec_lgl

## if_else_rvec needed when
## 'condition' is an rvec
if_else_rvec(x > 10, 10, x)

## dplyr::if_else works when
## 'true', 'false', or 'missing'
## (but not 'condition') are rvecs
library(dplyr)
if_else(c(TRUE, FALSE, TRUE), x, 100)
```

is_rvec

*Is an Object an Rvec***Description**

Test whether x inherits from class "rvec".

Usage

```
is_rvec(x)
```

Arguments

x An object.

Value

TRUE or FALSE.

See Also

- [rvec\(\)](#) to create an rvec
- [as.matrix\(\)](#), [as_list_col\(\)](#), to convert an rvec into other formats

Examples

```
x <- rvec_dbl()
is_rvec(x)
```

`map_rvec`*Apply a Function and Put Results in an Rvec*

Description

Apply function `.f` to each element of `.x`, and then combine the results into an `rvec` with the same length as `.x`.

Usage

```
map_rvec(.x, .f, ...)
```

Arguments

<code>.x</code>	A vector.
<code>.f</code>	A function.
<code>...</code>	Additional arguments passed to <code>.f</code> .

Details

Each call to function `.f` should produce an `rvec` with length 1.

Value

An `rvec` with the same length as `.x`.

See Also

`map_rvec()` is based on the map functions in package `purrr`, though the internal implementation is different.

Base R functions `sapply()` and `vapply()` do not work properly with `rvecs`. `[lapply()` works, but to combine the results into a single `rvec`, functions such as `c()` or `vctrs::vec_c()` are needed.

Examples

```
l <- list(a = rvec(matrix(1:2, 1)),
          b = rvec(matrix(1:4, 2)),
          c = rvec(matrix(1:6, 3)))
l
map_rvec(l, sum)

## sapply does not work with rvecs
sapply(l, sum)
```

matrixOps.rvec

*Matrix Multiplication with Rvecs***Description**

Matrix multiplication `%%` can be used with [rvecs](#). However, in contrast to standard R vectors, multiplying an rvec by a matrix does not produce a row or column vector. Instead it produces an ordinary rvec, with no dimensions.

Usage

```
## S3 method for class 'rvec'
matrixOps(x, y)
```

Arguments

`x, y` Vectors, matrices, or rvecs.

Value

An rvec, if `x` or `y` is an rvec.

Examples

```
A <- matrix(c(10, 10, 10,
              11, 11, 11),
            nrow = 2, byrow = TRUE)
x <- rvec(list(c(1, 2),
               c(3, 4),
               c(5, 6)))

A %% x

## matrix multiplication with an
## ordinary R matrix produces
## a row or column vector
y <- c(1, 3, 5)
A %% y
```

missing

*Missing, Finite, and Infinite Values in Rvecs***Description**

Detect or remove missing and infinite values in rvecs. Operations are done independently on each draw, though `na.omit()`, `na.exclude()`, and `na.fail()` also look across draws.

Usage

```
## S3 method for class 'rvec'
anyNA(x, recursive = FALSE)

## S3 method for class 'rvec'
is.na(x)

## S3 method for class 'rvec'
na.exclude(object, ...)

## S3 method for class 'rvec'
na.omit(object, ...)
```

Arguments

<code>x, object</code>	An <i>rvec</i> .
<code>recursive</code>	Whether <code>anyNA()</code> should be applied recursively to lists. Ignored when <code>x</code> is an <i>rvec</i> .
<code>...</code>	Currently ignored.

Details

The behavior of the *rvec* methods for `is.na()`, `is.nan()`, `is.finite()`, and `is.infinite()` differs from the standard *vctrs* behavior, which is to return a logical vector with length equal to `length(x)`. With *rvecs*, the standard *vctrs* behavior would entail summarising across draws, which is the job of the `draws_*` functions.

Value

- `anyNA()` - A logical *rvec* with length 1.
- `is.na()`, `is.nan()`, `is.finite()`, `is.infinite()` - A logical *rvec* with the same length as the original *rvec*.
- `na.omit()`, `na.exclude()` - An *rvec* with the same class as the original *rvec*, minus any elements that have NAs in any draws.
- `na.fail()` - The original *rvec*, or an error.

See Also

- `if_else_rvec()` for modifying individual values within draws.
- Base R functions `is.na()`, `is.nan()`, `is.finite()`, `is.infinite()`, `anyNA()`, `na.omit()`, `na.exclude()`
- `vctrs::vec_detect_missing()` to test whether all draws for an observation are missing.
- `vctrs::vec_detect_complete()` to test whether any draws for an observation are missing.
- `draws_any()`, `draws_all()` to summarise across draws.

Examples

```

x <- rvec(list(c(1.2, NA),
               c(Inf, 3),
               c(-1, NaN)))

## return a logical rvec
is.na(x)
is.nan(x)
is.finite(x)
is.infinite(x)

## return a logical rvec with length 1
anyNA(x)

## summarise across draws
draws_any(anyNA(x))

## return an NA-free version of 'x'
na.omit(x)
na.exclude(x)

## use 'if_else_rvec' to modify values
## within rvec
if_else_rvec(is.na(x), 999, x)

## vctrs functions
library(vctrs, warn.conflicts = FALSE)
## all draws missing
vec_detect_missing(x)
## any draws missing
vec_detect_complete(x)

```

new_rvec

*Create a Blank Rvec***Description**

Create an rvec, consisting entirely of NAs, with a given length and number of draws.

Usage

```
new_rvec(x = double(), length = 0, n_draw = 1000)
```

Arguments

x	Object with the intended type. Default is double().
length	Desired length of rvec. Default is 0.
n_draw	Number of draws of rvec. Default is 1000.

Details

The type of the object is taken from `x`. If `typeof(x)` is "integer", for instance, then `new_rvec()` returns an object of class "rvec_int".

Value

An rvec.

See Also

- `rvec()` `rvec_chr()`, `rvec_dbl()`, `rvec_int()`, `rvec_lgl()` Create an rvec from data.
- `n_draw()` Query number of draws.

Examples

```
new_rvec()
new_rvec(TRUE, length = 3, n_draw = 100)

x <- new_rvec(length = 2)
x[1] <- rnorm_rvec(n = 1, n_draw = 1000)
x[2] <- runif_rvec(n = 1, n_draw = 1000)
```

n_draw	<i>Query Number of Draws</i>
--------	------------------------------

Description

Get a count of the random draws held by `x`. If `x` does not hold random draws, then `n_draw()` throws an error.

Usage

```
n_draw(x)

## Default S3 method:
n_draw(x)

## S3 method for class 'rvec'
n_draw(x)
```

Arguments

`x` An object that holds random draws, eg an `rvec`.

Value

An integer scalar.

See Also

- [is_rvec\(\)](#) to test if an object is an rvec.

Examples

```
m <- matrix(1:40, nrow = 4, ncol = 10)
x <- rvec(m)
n_draw(x)
```

prob

Calculate Probabilities from Random Draws

Description

Convert an rvec of logical values (an [rvec_lgl](#)) into a vector of probabilities.

Usage

```
prob(x, na_rm = FALSE)

## S3 method for class 'rvec_lgl'
prob(x, na_rm = FALSE)

## S3 method for class 'logical'
prob(x, na_rm = FALSE)
```

Arguments

x	An object of class rvec_lgl .
na_rm	Whether to remove NAs before calculating summaries. Default is FALSE.

Details

`prob()` is essentially just [draws_mean\(\)](#) with a different name. The proportion of draws that are TRUE is used as an estimate of the underlying probability. The different name can make the intent of the code clearer.

Value

A logical vector with the same length as x.

See Also

- [draws_mean\(\)](#) Means across draws. Gives the same result as `prob` when applied to logical rvecs.

Examples

```
m <- rbind(c(FALSE, TRUE),
           c(TRUE, TRUE),
           c(FALSE, FALSE))
x <- rvec(m)
x
prob(x)

## logical rvec created on the fly
## through operations such as '>'
m <- rbind(c(-1, 1.3, 2),
           c(2, 0.1, -1),
           c(Inf, 0, -0.5))
y <- rvec(m)
y
prob(y > 0)
prob(y >= 0)
prob(y^2 > 0)
```

rank

Sample Ranks, Including Rvecs

Description

Calculate sample ranks for ordinary vectors or for rvecs. In the case of rvecs, ranks are calculated independently for each draw.

Usage

```
rank(
  x,
  na.last = TRUE,
  ties.method = c("average", "first", "last", "random", "max", "min")
)
```

Arguments

x	An ordinary vector or an rvec() .
na.last	Treatment of NAs. Options are TRUE, FALSE, or "keep". See base::rank() for details.
ties.method	Treatment of ties. See base::rank() for details.

Details

To enable different behavior for rvecs and for ordinary vectors, the base R function [base::rank\(\)](#) is turned into a generic, with [base::rank\(\)](#) as the default.

For details on the calculations, see the documentation for [base::rank\(\)](#).

Value

An object of class `rvec_int()` if `x` is an `rvec`. Otherwise an ordinary integer vector.

Examples

```
x <- rvec(list(c(3, 30),  
              c(0, 100)))  
rank(x)
```

`reg_post`*Posterior Sample from Linear Regression*

Description

Posterior sample for parameters from a linear regression model.

Usage

```
reg_post
```

Format

A matrix with 200 columns and the following rows:

- `alpha`: Intercept parameter
- `beta`: Slope parameter
- `sigma`: Standard deviation of error term

Source

`reg_post` contains values from the second half of the `line` dataset in package `coda`. The `line` dataset draws on the BUGS manual: Spiegelhalter, D.J., Thomas, A., Best, N.G. and Gilks, W.R. (1995) BUGS: Bayesian inference using Gibbs Sampling, Version 0.5, MRC Biostatistics Unit, Cambridge.

rvec*Create an Rvec from Data*

Description

Create an object of class "rvec", based on input data.

Usage

```
rvec(x)

rvec_chr(x = NULL)

rvec_dbl(x = NULL)

rvec_int(x = NULL)

rvec_lgl(x = NULL)
```

Arguments

x A matrix, a list of vectors, an atomic vector, or an rvec.

Details

Class "rvec" has four subclasses, each dealing with a different type:

- "rvec_dbl" doubles
- "rvec_int" integers
- "rvec_lgl" logical
- "rvec_chr" character

These subclasses are analogous to `double()`, `integer()`, `logical()`, and `character()` vectors.

Function `rvec()` chooses the subclass, based on `x`. Functions `rvec_dbl()`, `rvec_int()`, `rvec_lgl()`, and `rvec_chr()` each create objects of a particular subclass.

`x` can be

- a matrix, where each row is a set of draws for an unknown quantity;
- a list, where each element is a set of draws;
- an atomic vector, which is treated as a single-column matrix; or
- an rvec.

Value

An rvec with the following class:

- `rvec_dbl()`: "rvec_dbl"
- `rvec_int()`: "rvec_int"
- `rvec_lgl()`: "rvec_lgl"
- `rvec_chr()`: "rvec_chr"
- `rvec()`: "rvec_chr", "rvec_dbl", "rvec_int", or "rvec_lgl"

See Also

- [new_rvec\(\)](#) Create a blank rvec.
- [collapse_to_rvec\(\)](#) Create rvecs within a data frame.
- [rnorm_rvec\(\)](#), [rbinom_rvec\(\)](#), etc. Create rvecs representing probability distributions.

Examples

```
m <- rbind(c(-1.5, 2, 0.2),
           c(-2.3, 3, 1.2))
rvec_dbl(m)

l <- list(rpois(100, lambda = 10.2),
         rpois(100, lambda = 5.5))
rvec(l)

rvec(letters[1:5])

l <- list(a = c(TRUE, FALSE),
         b = c(FALSE, TRUE))
rvec(l)
```

sd

Standard Deviation, Including Rvecs

Description

Calculate standard deviation of `x`, where `x` can be an rvec. If `x` is an rvec, separate standard deviations are calculated for each draw.

Usage

```
sd(x, na.rm = FALSE)
```

Arguments

<code>x</code>	A numeric vector or R object, including an rvec() .
<code>na.rm</code>	Whether to remove NAs before calculating standard deviations.

Details

To enable different behavior for rvecs and for ordinary vectors, the base R function `stats::sd()` is turned into a generic, with `stats::sd()` as the default.

For details on the calculations, see the documentation for `stats::sd()`.

Value

An rvec, if `x` is an rvec. Otherwise typically a numeric vector.

See Also

`var()`

Examples

```
x <- rvec(cbind(rnorm(10), rnorm(10, sd = 20)))
x
sd(x)
```

var

Correlation, Variance and Covariance (Matrices), Including Rvecs

Description

Calculate correlations and variances, including when `x` or `y` is an rvec.

Usage

```
var(x, y = NULL, na.rm = FALSE, use)
```

Arguments

<code>x</code>	A numeric vector, matrix, data frame, or <code>rvec()</code> .
<code>y</code>	NULL (default) or a vector, matrix, data frame, or rvec with compatible dimensions to <code>x</code> .
<code>na.rm</code>	Whether NAs removed before calculations.
<code>use</code>	Calculation method. See <code>stats::var()</code> .

Details

To enable different behavior for rvecs and for ordinary vectors, the base R function `stats::var()` is turned into a generic, with `stats::var()` as the default.

For details on the calculations, see the documentation for `stats::var()`.

Value

An rvec, if `x` or `y` is an rvec. Otherwise typically a numeric vector or matrix.

See Also[sd\(\)](#)**Examples**

```
x <- rvec(cbind(rnorm(10), rnorm(10, sd = 20)))
x
var(x)
```

weighted_mean

*Calculate Weighted Summaries***Description**

Calculate weighted

- means
- medians
- MADs (mean absolute deviations)
- variances
- standard deviations.

These functions all work with ordinary vectors and with [rvecs](#).

Usage

```
weighted_mean(x, wt = NULL, na_rm = FALSE)

## Default S3 method:
weighted_mean(x, wt = NULL, na_rm = FALSE)

## S3 method for class 'rvec'
weighted_mean(x, wt = NULL, na_rm = FALSE)

weighted_mad(x, wt = NULL, na_rm = FALSE)

## Default S3 method:
weighted_mad(x, wt = NULL, na_rm = FALSE)

## S3 method for class 'rvec'
weighted_mad(x, wt = NULL, na_rm = FALSE)

weighted_median(x, wt = NULL, na_rm = FALSE)

## Default S3 method:
weighted_median(x, wt = NULL, na_rm = FALSE)
```

```
## S3 method for class 'rvec'
weighted_median(x, wt = NULL, na_rm = FALSE)

weighted_sd(x, wt = NULL, na_rm = FALSE)

## Default S3 method:
weighted_sd(x, wt = NULL, na_rm = FALSE)

## S3 method for class 'rvec'
weighted_sd(x, wt = NULL, na_rm = FALSE)

weighted_var(x, wt = NULL, na_rm = FALSE)

## Default S3 method:
weighted_var(x, wt = NULL, na_rm = FALSE)

## S3 method for class 'rvec'
weighted_var(x, wt = NULL, na_rm = FALSE)
```

Arguments

<code>x</code>	Quantity being summarised. An ordinary vector or an rvec .
<code>wt</code>	Weights. An ordinary vector, an rvec , or NULL (the default.) If NULL, an unweighted summary is returned.
<code>na_rm</code>	Whether to remove NAs in <code>x</code> or <code>wt</code> before calculating. Default is FALSE. See matrixStats::weightedMean() for a description of the algorithm used.

Details

`x` and `wt` must have the same length.

Internally the calculations are done by [matrixStats](#) functions such as [matrixStats::weightedMean\(\)](#) and [matrixStats::colWeightedMeans\(\)](#).

Value

If `x` or `wt` or is [rvec](#), then an [rvec](#) of length 1. Otherwise, a scalar.

See Also

- Functions [mean\(\)](#), [median\(\)](#), [mad\(\)](#), [var\(\)](#), [sd\(\)](#) for unweighted data all have methods for [rvecs](#)
- The original [matrixStats](#) weighted summary functions have additional options not implemented in the functions here.
- [weighted.mean\(\)](#) is a base R function for weighted data
- For numeric summaries of draws in an [rvec](#), use [draws_median\(\)](#), [draws_mean](#), [draws_quantile\(\)](#), [draws_fun\(\)](#).

Examples

```
## 'x' is rvec, 'wt' is ordinary vector
v <- rvec(list(c(1, 11),
               c(2, 12),
               c(7, 17)))
weights <- c(40, 80, 72)
weighted_mean(v, wt = weights)

## 'x' is ordinary vector, 'wt' is rvec
y <- c(1, 2, 3)
w <- rvec(list(c(100, 200),
               c(210, 889),
               c(200, 200)))
weighted_mean(y, wt = w)
weighted_mean(y, wt = w, na_rm = TRUE)
```
