

# Package ‘tfarima’

October 14, 2022

**Type** Package

**Title** Transfer Function and ARIMA Models

**Version** 0.3.2

**Date** 2022-05-20

**Description** Building customized transfer function and ARIMA models with multiple operators and parameter restrictions. Functions for model identification, model estimation (exact or conditional maximum likelihood), model diagnostic checking, automatic outlier detection, calendar effects, forecasting and seasonal adjustment. See Bell and Hillmer (1983) <[doi:10.1080/01621459.1983.10478005](https://doi.org/10.1080/01621459.1983.10478005)>, Box, Jenkins, Reinsel and Ljung <ISBN:978-1-118-67502-1>, Box, Pierce and Newbold (1987) <[doi:10.1080/01621459.1987.10478430](https://doi.org/10.1080/01621459.1987.10478430)>, Box and Tiao (1975) <[doi:10.1080/01621459.1975.10480264](https://doi.org/10.1080/01621459.1975.10480264)>, Che

**Author** Jose L. Gallego [aut, cre]

**Maintainer** Jose L. Gallego <jose.gallegoj@unican.es>

**URL** <https://github.com/gallegoj/tfarima>

**License** GPL-2

**Imports** Rcpp (>= 1.0.0), stats, numDeriv, zoo

**LinkingTo** Rcpp, RcppArmadillo

**Suggests** knitr, rmarkdown

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.1.2

**Depends** R (>= 2.10)

**VignetteBuilder** knitr

**NeedsCompilation** yes

**Repository** CRAN

**Date/Publication** 2022-05-20 10:50:02 UTC

---

**tfarima-package**      *Transfer Function and ARIMA Models.*

---

**Description**

The tfarima package provides classes and methods to build customized transfer function and ARIMA models with multiple operators and parameter restrictions. The package also includes functions for model identification, model estimation (exact or conditional maximum likelihood), model diagnostic checking, automatic outlier detection, calendar effects, forecasting and seasonal adjustment.

## **as.lagpol**

### *Lag polynomial*

## **Description**

`as.lagpol` converts a numeric vector  $c(1, -a_1, \dots, -a_d)$  into a lag polynomial  $(1 - a_1B - \dots - a_pB^p)$ .

## **Usage**

```
as.lagpol(pol, p = 1)
```

## **Arguments**

<code>pol</code>	a numeric vector.
<code>p</code>	integer power.

## **Value**

An object of class `lagpol`.

## **Examples**

```
as.lagpol(c(1, -0.8))
as.lagpol(c(1, 0, 0, 0, -0.8))
```

<code>as.um</code>	<i>Convert arima into um.</i>
--------------------	-------------------------------

### Description

`as.um` converts an object of class `arima` into an object of class `um`.

### Usage

```
as.um(arima)
```

### Arguments

`arima`      an object of class `arima`.

### Value

An object of class `um`.

### Examples

```
z <- AirPassengers
a <- arima(log(z), order = c(0,1,1),
            seasonal = list(order = c(0,1,1), frequency = 12))
um1 <- as.um(a)
```

<code>autocorr</code>	<i>Theoretical simple/partial autocorrelations of an ARMA model</i>
-----------------------	---

### Description

`autocorr` computes the simple/partial autocorrelations of an ARMA model.

### Usage

```
autocorr(um, ...)
## S3 method for class 'um'
autocorr(um, lag.max = 10, par = FALSE, ...)
```

### Arguments

<code>um</code>	an object of class <code>um</code> .
<code>...</code>	additional arguments.
<code>lag.max</code>	maximum lag for autocovariances.
<code>par</code>	logical. If TRUE partial autocorrelations are computed.

**Value**

A numeric vector.

**Note**

The I polynomial is ignored.

**Examples**

```
ar1 <- um(ar = "1-0.8B")
autocorr(ar1, lag.max = 13)
autocorr(ar1, lag.max = 13, par = TRUE)
```

autocov.stsm

*Theoretical autocovariances of an ARMA model***Description**

autocov computes the autocovariances of an ARMA model.

**Usage**

```
## S3 method for class 'stsm'
autocov(mdl, ...)

autocov(mdl, ...)

## S3 method for class 'um'
autocov(mdl, lag.max = 10, ...)
```

**Arguments**

mdl	an object of class <code>um</code> or <code>stsm</code> .
...	additional arguments.
<code>lag.max</code>	maximum lag for autocovariances.

**Value**

A numeric vector.

**Note**

The I polynomial is ignored.

## Examples

```
# Local level model
b <- 1
C <- as.matrix(1)
stsm1 <- stsm(b = b, C = C, s2v = c(lvl = 1469.619), s2u = c(irr = 15103.061))
autocov(stsm1)

ar1 <- um(ar = "1-0.8B")
autocov(ar1, lag.max = 13)
```

bsm

*Basic Structural Time Series models*

## Description

bsm creates/estimates basic structural models for seasonal time series.

## Usage

```
bsm(
  y,
  bc = FALSE,
  seas = c("hd", "ht", "hs"),
  s2v = c(lvl = 0.2, slp = 0.05, seas = 0.075),
  s2u = 0.1,
  xreg = NULL,
  fSv = NULL,
  ...
)
```

## Arguments

y	an object of class <code>ts</code> , with frequency 4 or 12.
bc	logical. If TRUE logs are taken.
seas	character, type of seasonality (Harvey-Durbin (hd), Harvey-Todd (ht), Harrison- Steven (ht))
s2v	variances of the error vector $v_t$ .
s2u	variance of the error $u_t$ .
xreg	matrix of regressors.
fSv	function to create the covariance matrix of $v_t$ .
...	other arguments.

## Value

An object of class `stsm`.

## References

Durbin, J. and Koopman, S.J. (2012) Time Series Analysis by State Space Methods, 2nd ed., Oxford University Press, Oxford.

## Examples

```
bsm1 <- bsm(AirPassengers, bc = TRUE)
```

calendar.tfm

*Calendar effects*

## Description

calendar extends the ARIMA model `um` by including a set of deterministic variables to capture the calendar variation in a monthly time series. Two equivalent representations are available: (i) D0, D1, ..., D6, (ii) L, D1-D0, ..., D6-D0 where D0, D2, ..., D6 are deterministic variables representing the number of Sundays, Mondays, ..., Saturdays, L = D0 + D1 + ... + D6 is the of the month. Alternatively, the Leap Year indicator (`LPY`) can be included instead of L. The seven trading days can also be compacted into two variables: week days and weekends. Optionally, a deterministic variable to estimate the Easter effect can also be included, see "[easter](#)".

## Usage

```
## S3 method for class 'tfm'
calendar(
  mdl,
  y = NULL,
  form = c("dif", "td", "td7", "td6", "wd"),
  ref = 0,
  lom = TRUE,
  lpyear = TRUE,
  easter = FALSE,
  len = 4,
  easter.mon = FALSE,
  n.ahead = 0,
  p.value = 1,
  envir = NULL,
  ...
)
calendar(mdl, ...)

## S3 method for class 'um'
calendar(
  mdl,
```

```

y = NULL,
form = c("dif", "td", "td7", "td6", "wd"),
ref = 0,
lom = TRUE,
lpyear = TRUE,
easter = FALSE,
len = 4,
easter.mon = FALSE,
n.ahead = 0,
p.value = 1,
envir = NULL,
...
)

```

## Arguments

mdl	an object of class <a href="#">um</a> or <a href="#">tfm</a> .
y	a time series.
form	representation for calendar effects: (1) form = dif, L, D1-D0, ..., D6-D0; (2) form = td, LPY, D1-D0, ..., D6-D0; (3) form = td7, D0, D2, ..., D6; (4) form = td6, D1, D2, ..., D6; (5) form = wd, (D1+...+D5) - 2(D6+D0)/5.
ref	a integer indicating the the reference day. By default, ref = 0.
lom, lpyear	a logical value indicating whether or not to include the lom/lead year indicator.
easter	logical. If TRUE an Easter effect is also estimated.
len	the length of the Easter, integer.
easter.mon	logical. TRUE indicates that Easter Monday is a public holiday.
n.ahead	a positive integer to extend the sample period of the deterministic variables with n.ahead observations, which could be necessary to forecast the output.
p.value	estimates with a p-value greater than p.value are omitted.
envir	environment in which the function arguments are evaluated. If NULL the calling environment of this function will be used.
...	other arguments.

## Value

An object of class "[tfm](#)".

## References

W. R. Bell & S. C. Hillmer (1983) Modeling Time Series with Calendar Variation, Journal of the American Statistical Association, 78:383, 526-534, DOI: 10.1080/01621459.1983.10478005

## Examples

```

Y <- tfarima:::rsales
um1 <- um(Y, i = list(1, c(1, 12)), ma = list(1, c(1, 12)), bc = TRUE)
tfm1 <- calendar(um1)

```

---

CalendarVar*Calendar variables*

---

**Description**

CalendarVar creates a set of deterministic variables to capture calendar effects.

**Usage**

```
CalendarVar(
  x,
  form = c("dif", "td", "td7", "td6", "wd", "wd2", "null"),
  ref = 0,
  lom = TRUE,
  lpyear = TRUE,
  easter = FALSE,
  len = 4,
  easter.mon = FALSE,
  n.ahead = 0
)
```

**Arguments**

x	an object of class <code>ts</code> used to determine the sample period and frequency.
form	a character indicated the set of calendar variables: td, td7, td6, wd.
ref	a non-negative integer indicating the reference day.
lom	logical. If TRUE length of the month effect is also estimated.
lpyear	logical. If TRUE a leap year effect is also estimated.
easter	logical. If TRUE an additional deterministic variable is generated to capture Easter effects.
len	duration of the Easter, integer.
easter.mon	logical. It is TRUE if Holy Monday is a public holiday.
n.ahead	number of additional observations to extend the sample period.

**Value**

An object of class `mts` or `ts`.

**References**

Bell, W.R. and Hillmer, S.C. (1983) “Modeling time series with calendar variation”, Journal of the American Statistical Society, Vol. 78, pp. 526–534.

## Examples

```
Y <- rsales
X <- CalendarVar(Y, easter = TRUE)
```

**ccf.tfm**

*Cross-correlation check*

## Description

`ccf` displays ccf between prewhitened inputs and residuals.

## Usage

```
ccf.tfm(tfm, lag.max = NULL, method = c("exact", "cond"), envir = NULL, ...)
```

## Arguments

<code>tfm</code>	a <code>tfm</code> object.
<code>lag.max</code>	number of lags.
<code>method</code>	Exact/conditional residuals.
<code>envir</code>	environment in which the function arguments are evaluated. If <code>NULL</code> the calling environment of this function will be used.
<code>...</code>	additional arguments.

**coef.tfm**

*Coefficients of a transfer function model*

## Description

`coef` extracts the "coefficients" from a TF model.

## Usage

```
## S3 method for class 'tfm'
coef(object, ...)
```

## Arguments

<code>object</code>	a <code>tfm</code> object.
<code>...</code>	other arguments.

## Value

A numeric vector.

coef.um

*Coefficients of a univariate model***Description**

coef extracts the "coefficients" from a um object.

**Usage**

```
## S3 method for class 'um'
coef(object, ...)
```

**Arguments**

object	a um object.
...	other arguments.

**Value**

A numeric vector.

diagchk.tfm

*Diagnostic checking***Description**

diagchk displays tools for diagnostic checking.

**Usage**

```
## S3 method for class 'tfm'
diagchk(
  mdl,
  y = NULL,
  method = c("exact", "cond"),
  lag.max = NULL,
  lags.at = NULL,
  freq.at = NULL,
  std = TRUE,
  envir = NULL,
  ...
)
diagchk(mdl, ...)
```

```
## S3 method for class 'um'
diagchk(
  mdl,
  z = NULL,
  method = c("exact", "cond"),
  lag.max = NULL,
  lags.at = NULL,
  freq.at = NULL,
  std = TRUE,
  envir = NULL,
  ...
)
```

## Arguments

mdl	an object of class <code>um</code> .
y	an object of class <code>ts</code> .
method	exact or conditional residuals.
lag.max	number of lags for ACF/PACF.
lags.at	the lags of the ACF/PACF at which tick-marks are to be drawn.
freq.at	the frequencies of the (cum) periodogram at which tick-marks are to be drawn.
std	logical. If TRUE standardized residuals are shown.
envir	environment in which the function arguments are evaluated. If <code>NULL</code> the calling environment of this function will be used.
...	additional arguments.
z	optional, an object of class <code>ts</code> .

## Examples

```
z <- AirPassengers
airl <- um(z, i = list(1, c(1,12)), ma = list(1, c(1,12)), bc = TRUE)
diagchk(airl)
```

## Description

`display` shows graphs characterizing one or a list of ARMA models.

## Usage

```
display(um, ...)

## S3 method for class 'um'
display(
  um,
  lag.max = 25,
  n.freq = 501,
  log.spec = FALSE,
  graphs = c("acf", "pacf", "spec"),
  byrow = FALSE,
  eq = TRUE,
  ...
)

## Default S3 method:
display(um, ...)
```

## Arguments

um	an object of class <code>um</code> or a list of these objects.
...	additional arguments.
lag.max	number of lags for ACF/PACF.
n.freq	number of frequencies for the spectrum.
log.spec	logical. If TRUE log spectrum is computed.
graphs	vector of graphs.
byrow	orientation of the graphs.
eq	logical. If TRUE the model equation is used as title.

## Examples

```
um1 <- um(ar = "(1 - 0.8B)(1 - 0.8B^12)")
um2 <- um(ma = "(1 - 0.8B)(1 - 0.8B^12)")
display(list(um1, um2))
```

## Description

`easter` extends the ARIMA model `um` by including a regression variable to capture the Easter effect.

**Usage**

```
easter(um, ...)

## S3 method for class 'um'
easter(
  um,
  z = NULL,
  len = 4,
  easter.mon = FALSE,
  n.ahead = 0,
  envir = NULL,
  ...
)
```

**Arguments**

<code>um</code>	an object of class <code>um</code> .
<code>...</code>	other arguments.
<code>z</code>	a time series.
<code>len</code>	a positive integer specifying the duration of the Easter.
<code>easter.mon</code>	logical. If TRUE Easter Monday is also taken into account.
<code>n.ahead</code>	a positive integer to extend the sample period of the Easter regression variable with <code>n.ahead</code> observations, which could be necessary to forecast the output.
<code>envir</code>	environment in which the function arguments are evaluated. If <code>NULL</code> the calling environment of this function will be used.

**Value**

An object of class "`tfm`".

**Examples**

```
Y <- rsales
um1 <- um(Y, i = list(1, c(1, 12)), ma = list(1, c(1, 12)), bc = TRUE)
tfm1 <- easter(um1)
```

---

`fit.stsm`

*Estimation of a STS model*

---

**Description**

`fit` fits the stsm to the time series `y`.

**Usage**

```
## S3 method for class 'stsm'
fit(mdl, method = "BFGS", show.iter = FALSE, ...)
```

**Arguments**

<code>mdl</code>	an object of class <code>stsm</code> .
<code>method</code>	argument of the <code>optim</code> function.
<code>show.iter</code>	logical value to show or hide the estimates at the different iterations.
<code>...</code>	other arguments.

**Value**

An object of class "stsm" with the estimated variances.

**Examples**

```
# Local level model
b <- 1
C <- as.matrix(1)
stsm1 <- stsm(Nile, b, C, s2v = c(lvl = 0.5), s2u = c(irr = 1), fit = FALSE)
stsm1 <- fit(stsm1, method = "L-BFGS-B")
```

**fit.tfm***Estimation of the ARIMA model***Description**

`fit` fits the univariate model to the time series `z`.

**Usage**

```
## S3 method for class 'tfm'
fit(
  mdl,
  y = NULL,
  method = c("exact", "cond"),
  optim.method = "BFGS",
  show.iter = FALSE,
  fit.noise = TRUE,
  envir = NULL,
  ...
)
fit(mdl, ...)

## S3 method for class 'um'
fit(
  mdl,
  z = NULL,
  method = c("exact", "cond"),
```

```

optim.method = "BFGS",
show.iter = FALSE,
envir = NULL,
...
)

```

### Arguments

mdl	an object of class <code>um</code> or <code>tfm</code> .
y	a <code>ts</code> object.
method	Exact/conditional maximum likelihood.
optim.method	the <code>method</code> argument of the <code>optim</code> function.
show.iter	logical value to show or hide the estimates at the different iterations.
fit.noise	logical. If TRUE parameters of the noise model are fixed.
envir	environment in which the function arguments are evaluated. If <code>NULL</code> the calling environment of this function will be used.
...	additional arguments.
z	a time series.

### Value

A `tfm` object.  
 An object of class "um" with the estimated parameters.

### Note

The `um` function estimates the corresponding ARIMA model when a time series is provided. The `fit` function is useful to fit a model to several time series, for example, in a Monte Carlo study.

### Examples

```

z <- AirPassengers
airl <- um(i = list(1, c(1, 12)), ma = list(1, c(1, 12)), bc = TRUE)
airl <- fit(airl, z)

```

### Description

`fit2autocov` fits a STS model to a vector of theoretical autocovariances.

**Usage**

```
fit2autocov(mdl, ...)

## S3 method for class 'stsm'
fit2autocov(mdl, g, method = "BFGS", show.iter = FALSE, ...)
```

**Arguments**

<code>mdl</code>	an object of class <code>stsm</code> .
<code>...</code>	other arguments.
<code>g</code>	a vector of theoretical autocovariances ( <code>gamma[k]</code> , $k = 0, \dots, K$ ).
<code>method</code>	optimization method.
<code>show.iter</code>	logical. If TRUE, estimates at each iteration are printed.

**Value**

An object of class `stsm`.

**Examples**

```
um1 <- um(Nile, i = 1, ma = 1)
g <- autocov(um1, lag.max = 1)
# Local level model
b <- 1
C <- as.matrix(1)
stsm1 <- stsm(Nile, b, C, s2v = c(lvl = 0.5), s2u = c(irr = 1), fit = FALSE)
stsm2 <- fit2autocov(stsm1, g)
stsm2
```

**Description**

`ide` displays graphs useful to identify a tentative ARIMA model for a time series.

**Usage**

```
ide(
  Y,
  transf = list(),
  order.polreg = 0,
  lag.max = NULL,
  lags.at = NULL,
  freq.at = NULL,
  wn.bands = TRUE,
```

```

graphs = c("plot", "acf", "pacf"),
set.layout = TRUE,
byrow = TRUE,
main = "",
envir = NULL,
...
)

```

## Arguments

<code>Y</code>	Univariate or multivariate time series.
<code>transf</code>	Data transformations, list(bc = F, d = 0, D = 0, S = F), where bc is the Box-Cox logarithmic transformation, d and D are the number of nonseasonal and seasonal differences, and S is the annual sum operator.
<code>order.polreg</code>	an integer indicating the order of a polynomial trend.
<code>lag.max</code>	number of autocorrelations.
<code>lags.at</code>	the lags of the ACF/PACF at which tick-marks are to be drawn.
<code>freq.at</code>	the frequencies of the (cum) periodogram at which tick-marks are to be drawn.
<code>wn.bands</code>	logical. If TRUE confidence intervals for sample autocorrelations are computed assuming a white noise series.
<code>graphs</code>	graphs to be shown: plot, hist, acf, pacf, pgram, cpgram (cumulative periodogram), rm (range-median).
<code>set.layout</code>	logical. If TRUE the layout is set by the function, otherwise it is set by the user.
<code>byrow</code>	logical. If TRUE the layout is filled by rows, otherwise it is filled by columns.
<code>main</code>	title of the graph.
<code>envir</code>	environment in which the function arguments are evaluated. If NULL the calling environment of this function will be used.
<code>...</code>	additional arguments.

## Examples

```

Y <- AirPassengers
ide(Y, graphs = c("plot", "rm"))
ide(Y, transf = list(list(bc = TRUE, S = TRUE), list(bc = TRUE, d = 1, D = 1)))

```

## Description

`intervention` estimates the effect of a intervention at a known time.

## Usage

```
## S3 method for class 'tfm'
intervention(
  mdl,
  y = NULL,
  type,
  time,
  n.ahead = 0,
  envir = parent.frame(),
  ...
)

intervention(mdl, ...)

## S3 method for class 'um'
intervention(
  mdl,
  y = NULL,
  type,
  time,
  n.ahead = 0,
  envir = parent.frame(),
  ...
)
```

## Arguments

<code>mdl</code>	an object of class <code>um</code> or <code>tfm</code> .
<code>y</code>	a "ts" object, optional.
<code>type</code>	the type intervention (pulse, step, ramp) or the type of outlier (AO, LS, TC, IO).
<code>time</code>	the date of the intervention, in format <code>c(year, season)</code> .
<code>n.ahead</code>	a positive integer to extend the sample period of the intervention variable with <code>n.ahead</code> observations, which could be necessary to forecast the output.
<code>envir</code>	the environment in which to look for the time series <code>z</code> when it is passed as a character string.
<code>...</code>	additional arguments.

## Value

an object of class "`tfm`" or a table.

---

InterventionVar	<i>Intervention variables</i>
-----------------	-------------------------------

---

**Description**

InterventionVar creates an intervention variable to capture the effect of an external event.

**Usage**

```
InterventionVar(Y, date, type = c("P", "S", "R"), n.ahead = 0)
```

**Arguments**

- |         |  |
|---------|--|
| Y       | an object of class ts used to determine the sample period and frequency.             |
| date    | the date of the event, c(year, month).   |
| type    | a character indicating the type of intervention variables: (P) pulse, (S) step, (R). |
| n.ahead | number of additional observations to extend the sample period.                       |

**Value**

An intervention variable, a 'ts' object.

**References**

G. E. P. Box, G. C. Tiao, "Intervention Analysis with Applications to Economic and Environmental Problems", Journal of the American Statistical Association, Vol. 70, No. 349. (Mar., 1975), pp. 70-79.

**Examples**

```
Y <- seriesJ$Y
P58 <- InterventionVar(Y, date = 58, type = "P")
```

---

inv	<i>Inverse of a lag polynomial</i>
-----	------------------------------------

---

**Description**

inv inverts a lag polynomial until the indicated lag.

**Usage**

```
inv(lp, ...)

## S3 method for class 'lagpol'
inv(lp, lag.max = 10, ...)
```

**Arguments**

- `lp` an object of class `lagpol`.  
`...` additional arguments.  
`lag.max` largest order of the inverse lag polynomial.

**Value**

`inv` returns a numeric vector with the coefficients of the inverse lag polynomial truncated at `lag.max`.

**Examples**

```
inv(as.lagpol(c(1, 1.2, -0.8)))
```

**lagpol***Lag polynomials***Description**

`lagpol` creates a lag polynomial of the form  $(1 - coef_1B^s - \dots - coef_dB^{sd})^p$ . This class of lag polynomials is defined by a vector of d coefficients `c(coef_1, ..., coef_d)`, the powers `s` and `p`, and a vector of k parameters `c(param_1, ..., param_k)`. The vector `c(coef_1, ..., coef_d)` is actually a vector of math expressions to compute the value of each coefficient in terms of the parameters.

**Usage**

```
lagpol(param = NULL, s = 1, p = 1, lags = NULL, coef = NULL)
```

**Arguments**

- `param` a vector/list of named parameters.  
`s` the seasonal period, integer.  
`p` the power of lag polynomial, integer.  
`lags` a vector of lags for sparse polynomials.  
`coef` a vector of math expressions.

**Value**

`lagpol` returns an object of class "lagpol" with the following components:

- coef** Vector of coefficients  $c(coef\_1, \dots, coef\_p)$  provided to create the lag polynomial.
- pol** Base lag polynomial,  $c(1, -coef\_1, \dots, -coef\_d)$ .
- Pol** Power lag polynomial when  $p > 1$ .

**Examples**

```
lagpol(param = c(phi = 0.8) )
lagpol(param = c(phi1 = 1.2, phi2 = -0.6), s = 4)
lagpol(param = c(delta = 1), p = 2)
```

logLik.um

*Log-likelihood of an ARIMA model***Description**

`logLik` computes the exact or conditional log-likelihood of object of the class `um`.

**Usage**

```
## S3 method for class 'um'
logLik(object, z = NULL, method = c("exact", "cond"), ...)
```

**Arguments**

- |                     |                                      |
|---------------------|--------------------------------------|
| <code>object</code> | an object of class <code>um</code> . |
| <code>z</code>      | an object of class <code>ts</code> . |
| <code>method</code> | exact or conditional.                |
| <code>...</code>    | additional arguments.                |

**Value**

The exact or conditional log-likelihood.

---

`modify.tfm`*Modifying a TF or an ARIMA model*

---

## Description

`modify` modifies an object of class `um` or `tfm` by adding and/or removing lag polynomials.

## Usage

```
## S3 method for class 'tfm'
modify(mdl, ...)

modify(mdl, ...)

## S3 method for class 'um'
modify(
  mdl,
  ar = NULL,
  i = NULL,
  ma = NULL,
  mu = NULL,
  sig2 = NULL,
  bc = NULL,
  fit = TRUE,
  ...
)
```

## Arguments

<code>mdl</code>	an object of class <code>um</code> or <code>tfm</code> .
<code>...</code>	additional arguments.
<code>ar</code>	list of stationary AR lag polynomials.
<code>i</code>	list of nonstationary AR (I) polynomials.
<code>ma</code>	list of MA polynomials.
<code>mu</code>	mean of the stationary time series.
<code>sig2</code>	variance of the error.
<code>bc</code>	logical. If TRUE logs are taken.
<code>fit</code>	logical. If TRUE, model is fitted.

## Value

An object of class `um` or `um`.

**Examples**

```
um1 <- um(ar = "(1 - 0.8B)")  
um2 <- modify(um1, ar = list(0, "(1 - 0.9B)"), ma = "(1 - 0.5B)")
```

---

nabla

*Unscramble I polynomial*

---

**Description**

`nabla` multiplies the I polynomials of an object of the `um` class.

**Usage**

```
nabla(um)  
  
## S3 method for class 'um'  
nabla(um)
```

**Arguments**

`um`                   an object of class `um`.

**Value**

A numeric vector `c(1, a1, ..., ad)`

**Note**

This function returns the member variable `um$nabla`.

**Examples**

```
um1 <- um(i = "(1 - B)(1 - B^12)")  
nabla(um1)
```

noise	<i>Noise of a transfer function model</i>
-------	---

**Description**

noise computes the noise of a linear transfer function model.

**Usage**

```
noise(tfm, ...)

## S3 method for class 'tfm'
noise(tfm, y = NULL, diff = TRUE, exp = FALSE, envir = NULL, ...)
```

**Arguments**

- |       |   |
|-------|---|
| tfm   | an object of the class tfm.   |
| ...   | additional arguments.   |
| y     | output of the TF model if it is different to that of the tfm object.  |
| diff  | logical. If TRUE, the noise is differenced with the "i" operator of the univariate model of the noise.                    |
| exp   | logical. If TRUE, the antilog transformation is applied.  |
| envir | environment in which the function arguments are evaluated. If NULL the calling environment of this function will be used. |

**Value**

A "ts" object.

outlierDates	<i>Outlier dates</i>
--------------	----------------------

**Description**

outlierDates shows the indeces and dates of outliers.

**Usage**

```
outlierDates(x, c = 3)
```

**Arguments**

- |   |  |
|---|--|
| x | an ts object.  |
| c | critical value to determine whether or not an observation is an outlier. |

**Value**

A table with the indices, dates and z-scores of the outliers.

---

outliers.tfm	<i>Outliers detection at known/unknown dates</i>
--------------	--

---

**Description**

`outliers` performs a detection of four types of anomalies (AO, TC, LS and IO) in a time series described by an ARIMA model. If the dates of the outliers are unknown, an iterative detection process like that proposed by Chen and Liu (1993) is conducted.

**Usage**

```
## S3 method for class 'tfm'
outliers(
  mdl,
  y = NULL,
  types = c("AO", "LS", "TC", "IO"),
  dates = NULL,
  c = 3,
  calendar = FALSE,
  easter = FALSE,
  resid = c("exact", "cond"),
  n.ahead = NULL,
  p.value = 1,
  tc.fix = TRUE,
  envir = NULL,
  ...
)
outliers(mdl, ...)

## S3 method for class 'um'
outliers(
  mdl,
  y = NULL,
  types = c("AO", "LS", "TC", "IO"),
  dates = NULL,
  c = 3,
  calendar = FALSE,
  easter = FALSE,
  resid = c("exact", "cond"),
  n.ahead = 0,
  p.value = 1,
  tc.fix = TRUE,
  envir = NULL,
```

```
  ...
)
```

### Arguments

<code>mdl</code>	an object of class <code>um</code> or <code>tfm</code> .
<code>y</code>	an object of class <code>ts</code> , optional.
<code>types</code>	a vector with the initials of the outliers to be detected, <code>c("AO", "LS", "TC", "IO")</code> .
<code>dates</code>	a list of dates <code>c(year, season)</code> . If <code>dates = NULL</code> , an iterative detection process is conducted.
<code>c</code>	a positive constant to compare the z-ratio of the effect of an observation and decide whether or not it is an outlier. This argument is only used when <code>dates = NULL</code> .
<code>calendar</code>	logical; if true, calendar effects are also estimated.
<code>easter</code>	logical; if true, Easter effect is also estimated.
<code>resid</code>	type of residuals (exact or conditional) used to identify outliers.
<code>n.ahead</code>	a positive integer to extend the sample period of the intervention variables with <code>n.ahead</code> observations, which could be necessary to forecast the output.
<code>p.value</code>	estimates with a p-value greater than <code>p.value</code> are omitted.
<code>tc.fix</code>	a logical value indicating if the AR coefficient in the transfer function of the TC is estimated or fix.
<code>envir</code>	environment in which the function arguments are evaluated. If <code>NULL</code> the calling environment of this function will be used.
<code>...</code>	other arguments.

### Value

an object of class "`tfm`" or a table.

### Examples

```
Y <- rsales
um1 <- um(Y, i = list(1, c(1, 12)), ma = list(1, c(1, 12)), bc = TRUE)
outliers(um1)
```

---

output.tf	<i>Output of a transfer function</i>
-----------	--------------------------------------

---

### Description

output filters the input using the transfer function.

### Usage

```
output.tf(tf)
```

### Arguments

tf                   an object of the S3 class "tf".

### Value

A "ts" object

---

pccf	<i>Prewhitened cross correlation function</i>
------	---

---

### Description

pccf displays cross correlation function between input and output after prewhitening both through a univariate model.

### Usage

```
pccf(  
  x,  
  y,  
  um.x = NULL,  
  um.y = NULL,  
  lag.max = NULL,  
  plot = TRUE,  
  envir = NULL,  
  main = NULL,  
  nu.weights = FALSE,  
  ...  
)
```

**Arguments**

<code>x</code>	input, a 'ts' object or a numeric vector.
<code>y</code>	output, a 'ts' object or a numeric vector.
<code>um.x</code>	univariate model for input.
<code>um.y</code>	univariate model for output.
<code>lag.max</code>	number of lags, integer.
<code>plot</code>	logical value to indicate if the ccf graph must be graphed or computed.
<code>envir</code>	environment in which the function arguments are evaluated. If NULL the calling environment of this function will be used.
<code>main</code>	title of the graph.
<code>nu.weights</code>	logical. If TRUE the coefficients of the IRF are computed instead of the cross-correlations.
<code>...</code>	additional arguments.

**Value**

The estimated cross correlations are displayed in a graph or returned into a numeric vector.

<code>phi</code>	<i>Unscramble AR polynomial</i>
------------------	---------------------------------

**Description**

`phi` multiplies the AR polynomials of an object of the `um` class.

**Usage**

```
phi(um)

## S3 method for class 'um'
phi(um)
```

**Arguments**

<code>um</code>	an object of class <code>um</code> .
-----------------	--------------------------------------

**Value**

A numeric vector `c(1, a1, ..., ad)`

**Note**

This function returns the member variable `um$phi`.

**Examples**

```
um1 <- um(ar = "(1 - 0.8B)(1 - 0.5B)")
phi(um1)
```

pi.weights

*Pi weights of an AR(I)MA model***Description**

`pi.weights` computes the pi-weights of an AR(I)MA model.

**Usage**

```
pi.weights(um, ...)
## S3 method for class 'um'
pi.weights(um, lag.max = 10, var.pi = FALSE, ...)
```

**Arguments**

- `um` an object of class `um`.
- `...` additional arguments.
- `lag.max` largest AR(Inf) coefficient required.
- `var.pi` logical. If TRUE (FALSE), the I polynomials is considered (ignored).

**Value**

A numeric vector.

**Examples**

```
um1 <- um(i = "(1 - B)(1 - B^12)", ma = "(1 - 0.8B)(1 - 0.8B^12)")
pi.weights(um1, var.pi = TRUE)
```

## Description

`predict` computes point and interval predictions for a time series based on a `tfm` object.

## Usage

```
## S3 method for class 'tfm'
predict(
  object,
  newdata = NULL,
  y = NULL,
  ori = NULL,
  n.ahead = NULL,
  level = 0.95,
  i = NULL,
  envir = NULL,
  ...
)
```

## Arguments

<code>object</code>	an object of class <a href="#">um</a> .
<code>newdata</code>	new data for the predictors for the forecast period. This is a matrix if there is more than one predictor. The number of columns is equal to the number of predictors, the number of rows equal to <code>n.ahead</code> . If there is one predictor only the data may be provided alternatively as a vector.
<code>y</code>	an object of class <a href="#">ts</a> .
<code>ori</code>	the origin of prediction. By default, it is the last observation.
<code>n.ahead</code>	number of steps ahead.
<code>level</code>	confidence level.
<code>i</code>	transformation of the series <code>y</code> to be forecasted. It is a lagpol as those of a <a href="#">um</a> object.
<code>envir</code>	environment in which the function arguments are evaluated. If <code>NULL</code> the calling environment of this function will be used.
<code>...</code>	additional arguments.

## Details

Forecasts for the inputs of a `tfm` object can be provided in three ways: (1) extending the time series with forecasts so that the length of the input is greater than the length of the output, (2) computed internally from the `um` object associated to the input and (3) with the `newdata` argument.

---

**predict.um** *Forecasts from an ARIMA model*

---

**Description**

`predict` computes point and interval predictions for a time series from models of class [um](#).

**Usage**

```
## S3 method for class 'um'
predict(
  object,
  z = NULL,
  ori = NULL,
  n.ahead = 1,
  level = 0.95,
  i = NULL,
  envir = NULL,
  ...
)
```

**Arguments**

<code>object</code>	an object of class <a href="#">um</a> .
<code>z</code>	an object of class <a href="#">ts</a> .
<code>ori</code>	the origin of prediction. By default, it is the last observation.
<code>n.ahead</code>	number of steps ahead.
<code>level</code>	confidence level.
<code>i</code>	transformation of the series <code>z</code> to be forecasted. It is a lagpol as those of a <a href="#">um</a> object.
<code>envir</code>	environment in which the function arguments are evaluated. If <code>NULL</code> the calling environment of this function will be used.
<code>...</code>	additional arguments.

**Value**

An object of class "[tfm](#)".

**Examples**

```
Z <- AirPassengers
um1 <- um(Z, i = list(1, c(1, 12)), ma = list(1, c(1, 12)), bc = TRUE)
p <- predict(um1, n.ahead = 12)
p
plot(p, n.back = 60)
```

---

<code>printLagpol</code>	<i>Print numeric vector as a lagpol object</i>
--------------------------	--

---

**Description**

Print numeric vector as a lagpol object

**Usage**

```
printLagpol(pol, digits = 2)
```

**Arguments**

<code>pol</code>	numeric vectors with the coefficients of a normalized polynomial.
<code>digits</code>	number of decimals.

---

<code>printLagpolList</code>	<i>Print a list of lagpol objects</i>
------------------------------	---------------------------------------

---

**Description**

Print a list of lagpol objects

**Usage**

```
printLagpolList(llp, digits = 2)
```

**Arguments**

<code>llp</code>	a list of lagpol objects.
<code>digits</code>	number of decimals.

---

<code>psi.weights</code>	<i>Psi weights of an AR(I)MA model</i>
--------------------------	--

---

### Description

`psi` computes the psi-weights of an AR(I)MA model.

### Usage

```
psi.weights(um, ...)
## S3 method for class 'um'
psi.weights(um, lag.max = 10, var.psi = FALSE, ...)
```

### Arguments

um	an object of class <code>um</code> .
...	additional arguments.
lag.max	Largest MA(Inf) coefficient required.
var.psi	logical. If TRUE the I polynomials is also inverted. If FALSE it is ignored.

### Value

A numeric vector.

### Examples

```
um1 <- um(i = "(1 - B)(1 - B^12)", ma = "(1 - 0.8B)(1 - 0.8B^12)")
psi.weights(um1)
psi.weights(um1, var.psi = TRUE)
```

---

<code>residuals.tfm</code>	<i>Residuals of a transfer function model</i>
----------------------------	---

---

### Description

`residuals` computes the exact or conditional residuals of a TF model.

### Usage

```
## S3 method for class 'tfm'
residuals(object, y = NULL, method = c("exact", "cond"), envir = NULL, ...)
```

**Arguments**

- object** a `tfm` object.  
**y** output of the TF model (if it is different to that of the "tfm" object).  
**method** a character string specifying the method to compute the residuals, exact or conditional.  
**envir** environment in which the function arguments are evaluated. If `NULL` the calling environment of this function will be used.  
**...** additional arguments.

**Value**

A "ts" object.

`residuals.um`

*Residuals of the ARIMA model*

**Description**

`residuals` computes the exact or conditional residuals.

**Usage**

```
## S3 method for class 'um'
residuals(object, z = NULL, method = c("exact", "cond"), envir = NULL, ...)
```

**Arguments**

- object** an object of class `um`.  
**z** an object of class `ts`.  
**method** exact/conditional residuals.  
**envir** environment in which the function arguments are evaluated. If `NULL` the calling environment of this function will be used.  
**...** additional arguments.

**Value**

An object of class `um`.

**Examples**

```
z <- AirPassengers
airl <- um(z, i = list(1, c(1, 12)), ma = list(1, c(1, 12)), bc = TRUE)
r <- residuals(airl)
summary(r)
```

---

<code>rform</code>	<i>Reduce form for STS model</i>
--------------------	----------------------------------

---

### Description

`rform` finds the reduce form for a STS model.

### Usage

```
rform(mdl, ...)

## S3 method for class 'stsmt'
rform(mdl, ...)
```

### Arguments

<code>mdl</code>	an object of class <code>stsmt</code> .
...	other arguments.

### Value

An object of class `um`.

### Examples

```
b <- 1
C <- as.matrix(1)
stsmt1 <- stsmt(b = b, C = C, s2v = c(lvl = 1469.619), s2u = c(irr = 15103.061))
rf1 <- rform(stsmt1)
nabla(rf1)
theta(rf1)
```

---

<code>roots</code>	<i>Roots of the lag polynomials of an ARIMA model</i>
--------------------	---

---

### Description

`roots` compute the roots of the AR, I, MA lag polynomials an ARIMA model.

### Usage

```
roots(x, ...)

## S3 method for class 'um'
roots(x, opr = c("arma", "ar", "ma", "i", "arima"), ...)
```

**Arguments**

- x an object of class um.
- ... additional arguments.
- opr character that indicates which operators are selected.

**Value**

List of matrices with the roots of each single polynomial.

**Examples**

```
um1 <- um(ar = "(1 - 0.8B)(1 - 0.8B^12)")
roots(um1)
```

---

**roots.lagpol**

*Roots of a lag polynomial*

---

**Description**

`roots.lagpol` computes the roots of a lag polynomial.

**Usage**

```
## S3 method for class 'lagpol'
roots(x, table = TRUE, ...)

## Default S3 method:
roots(x, ...)
```

**Arguments**

- x an object of class lagpol.
- table logical. If TRUE, it returns a five columns table showing the real and imaginary parts, the modulus, the frequency and the period of each root.
- ... additional arguments.

**Value**

A vector or a table.

**Examples**

```
roots(c(1, 1.2, -0.8))
```

---

rsales

*Retail Sales of Variety Stores (U.S. Bureau of the Census)*

---

### Description

156 monthly observations from January 1967 to December 1979.

### Usage

rsales

### Format

An object of class ts of length 156.

### References

Chen, C. and Liu, L. (1993) Joint Estimation of Model Parameters and Outlier Effects in Time Series, Journal of the American Statistical Association, Vol. 88, No. 421, pp. 284-297

---

S

*Annual sum*

---

### Description

S generates the annual sum of a monthly or quarterly time series.

### Usage

S(x, extend = TRUE)

### Arguments

- |        |  |
|--------|--|
| x      | an ts object.  |
| extend | logical. If TRUE, the transformed series is extended with NA's to have the same length as the original series. |

### Value

The transformed time series, a ts object.

---

sdummies	<i>Seasonal dummies</i>
----------	-------------------------

---

### Description

`sdummies` creates a full set of seasonal dummies.

### Usage

```
sdummies(Y, ref = 1, constant = FALSE, n.ahead = 0)
```

### Arguments

<code>Y</code>	an object of class <code>ts</code> used to determine the sample period and frequency.
<code>ref</code>	the reference season, positive integer
<code>constant</code>	logical indicator to include a column of ones.
<code>n.ahead</code>	number of additional observations to extend the sample period.

### Value

A matrix of trigonometric variables.

### Examples

```
Y <- AirPassengers
P58 <- sincos(Y)
```

---

seasadj	<i>Seasonal adjustment</i>
---------	----------------------------

---

### Description

`seasadj` removes the seasonal component of time series.

### Usage

```
seasadj(mdl, ...)

## S3 method for class 'um'
seasadj(
  mdl,
  z = NULL,
  method = c("mixed", "forecast", "backcast"),
  envir = NULL,
  ...
)
```

**Arguments**

mdl	an object of class <a href="#">um</a> or <a href="#">tfm</a> .
...	additional arguments.
z	an object of class <a href="#">ts</a> .
method	forward/backward forecasts or a mixture of the two.
envir	environment in which the function arguments are evaluated. If NULL the calling environment of this function will be used.

**Value**

`seasadj` returns a seasonal adjusted time series.

**Examples**

```
Y <- AirPassengers
um1 <- um(Y, bc = TRUE, i = list(1, c(1,12)), ma = list(1, c(1,12)))
Y <- seasadj(um1)
ide(Y)
```

---

**seriesC**

*Series C Chemical Process Temperature Readings: Every Minute.*

---

**Description**

226 observations.

**Usage**

```
seriesC
```

**Format**

An object of class `numeric` of length 226.

**References**

Box, G.E., Jenkins, G.M., Reinsel, G.C. and Ljung, G.M. (2015) Time Series Analysis: Forecasting and Control. John Wiley & Sons, Hoboken.

seriesJ	<i>Gas furnace data</i>
---------	-------------------------

### Description

Sampling interval 9 seconds; observations for 296 pairs of data points.

### Usage

```
seriesJ
```

### Format

A object of class data.frame with 296 rows and 2 columns:

**X** 0.60-0.04 (input gas rate in cubir feet per minute.)

**Y** % CO<sub>2</sub> in outlet gas.

### References

Box, G.E., Jenkins, G.M., Reinsel, G.C. and Ljung, G.M. (2015) Time Series Analysis: Forecasting and Control. John Wiley & Sons, Hoboken.

setinputs.tfm	<i>setinputs adds new inputs into a transfer function model.</i>
---------------	--

### Description

`setinputs` adds new inputs into a transfer function model.

### Usage

```
## S3 method for class 'tfm'
setinputs(
  mdl,
  xreg = NULL,
  inputs = NULL,
  y = NULL,
  envir = parent.frame(),
  ...
)
setinputs(mdl, ...)

## S3 method for class 'um'
setinputs(mdl, xreg = NULL, inputs = NULL, y = NULL, envir = NULL, ...)
```

**Arguments**

mdl	a umm or tfm object.
xreg	a matrix of inputs.
inputs	a list of tf objects.
y	an optional ts object.
envir	an environment.
...	other arguments.

**Value**

A tfm object.

sform

*Structural form for an ARIMA model*

**Description**

sform finds the structural form for an ARIMA model from its the eventual forecast function.

**Usage**

```
sform(mdl, ...)

## S3 method for class 'um'
sform(mdl, fSv = NULL, par = NULL, ...)
```

**Arguments**

mdl	an object of class um.
...	other arguments.
fSv	optional function to create the covariance matrix.
par	vector of parameters for function fSv.

**Value**

An object of class stsm

**Examples**

```
airl <- um(i = list(1, c(1, 12)), ma = "(1 - 0.86B)(1 - 0.8B12)")
sf <- sform(airl)
sf
```

signal	<i>Signal component of a TF model</i>
--------	---------------------------------------

### Description

`signal` extracts the signal of a TF model.

### Usage

```
signal(mdl, ...)

## S3 method for class 'tfm'
signal(mdl, y = NULL, diff = TRUE, envir = NULL, ...)
```

### Arguments

<code>mdl</code>	an object of the class <code>tfm</code> .
<code>...</code>	additional arguments.
<code>y</code>	output of the TF model if it is different to that of the <code>tfm</code> object.
<code>diff</code>	logical. If TRUE, the noise is differenced with the "i" operator of the univariate model of the noise.
<code>envir</code>	environment in which the function arguments are evaluated. If NULL the calling environment of this function will be used.

### Value

A "ts" object.

sim.tfm	<i>Time series simulation form an ARIMA or TF model</i>
---------	---

### Description

`sim` generates a random time series from an object of class `um` or `tfm`.

### Usage

```
## S3 method for class 'tfm'
sim(mdl, n = 100, y0 = NULL, seed = NULL, ...)

sim(mdl, ...)

## S3 method for class 'um'
sim(
```

```

mdl,
n = 100,
z0 = NULL,
n0 = 0,
a = NULL,
seed = NULL,
envir = parent.frame(),
...
)

```

**Arguments**

mdl	an object of class <code>um</code> or <code>tfm</code> .
n	number of observations.
y0	initial conditions for the nonstationary series.
seed	an integer.
...	other arguments.
z0	initial conditions for the nonstationary series.
n0	remove the <code>n0</code> first observation, integer.
a	vector of innovations, optional.
envir	environment in which the function arguments are evaluated. If <code>NULL</code> the calling environment of this function will be used.

**Value**

An object of class `ts`.

sincos	<i>Trigonometric variables</i>
--------	--------------------------------

**Description**

`sincos` creates a full set of trigonometric variables.

**Usage**

```
sincos(Y, n.ahead = 0, constant = FALSE)
```

**Arguments**

Y	an object of class <code>ts</code> used to determine the sample period and frequency.
n.ahead	number of additional observations to extend the sample period.
constant	logical indicator to include a column of ones.

**Value**

A matrix of trigonometric variables.

**Examples**

```
Y <- AirPassengers
P58 <- sincos(Y)
```

spec

*Spectrum of an ARMA model*

**Description**

`spec` computes the spectrum of an ARMA model.

**Usage**

```
spec(um, ...)
## S3 method for class 'um'
spec(um, n.freq = 501, ...)
```

**Arguments**

<code>um</code>	an object of class <code>um</code> .
<code>...</code>	additional parameters.
<code>n.freq</code>	number of frequencies.

**Value**

A matrix with the frequencies and the power spectral densities.

**Note**

The I polynomial is ignored.

**Examples**

```
um1 <- um(i = "(1 - B)(1 - B^12)", ma = "(1 - 0.8B)(1 - 0.8B^12)")
s <- spec(um1, lag.max = 13)
```

---

std	<i>Standardize time series</i>
-----	--------------------------------

---

**Description**

std standardizes a time series.

**Usage**

```
std(x)
```

**Arguments**

x                    a ts object.

**Value**

The standardized time series.

---

stsm	<i>Structural Time Series models</i>
------	--------------------------------------

---

**Description**

stsm creates an S3 object representing a time-invariant structural time series model.

**Usage**

```
stsm(y, b, C, fSv, s2v, s2u = 1, xreg = NULL, bc = FALSE, fit = TRUE, ...)
```

**Arguments**

y	an object of class ts.
b	vector of constants.
C	matrix of constants.
fSv	function to create the covariance matrix of v_t.
s2v	variances of the vector error v_t in the state equation.
s2u	variance of the error u_t in the observation equation.
xreg	matrix of regressors.
bc	logical. If TRUE logs are taken.
fit	logical. If TRUE, model is fitted.
...	other arguments.

## Details

$y_t = b'x_t + u_t$  (observation equation),  $x_t = Cx_{t-1} + v_t$  (state equation).

## Value

An object of class `stsm`.

## References

Durbin, J. and Koopman, S.J. (2012) Time Series Analysis

## Examples

```
# Local level model
b <- 1
C <- as.matrix(1)
stsm1 <- stsm(Nile, b, C, s2v = c(lvl = 0.5), s2u = c(irr = 1))
stsm1
```

`summary.tfm`

*Summarizing Transfer Function models*

## Description

summary method for class "tfm".

## Usage

```
## S3 method for class 'tfm'
summary(
  object,
  y = NULL,
  method = c("exact", "cond"),
  digits = max(3L, getOption("digits") - 3L),
  envir = NULL,
  ...
)
```

## Arguments

<code>object</code>	a <code>tfm</code> object.
<code>y</code>	a "ts" object.
<code>method</code>	exact or conditional maximum likelihood.
<code>digits</code>	number of significant digits to use when printing.
<code>envir</code>	environment in which the function arguments are evaluated. If <code>NULL</code> the calling environment of this function will be used.
<code>...</code>	additional arguments.

**Value**

A `tfm` object.

---

`summary.um`*Summary of um model*

---

**Description**

`summary` prints a summary of the estimation and diagnosis.

**Usage**

```
## S3 method for class 'um'  
summary(  
  object,  
  z = NULL,  
  method = c("exact", "cond"),  
  digits = max(3L, getOption("digits") - 3L),  
  envir = NULL,  
  ...  
)
```

**Arguments**

<code>object</code>	an object of class <code>um</code> .
<code>z</code>	an object of class <code>ts</code> .
<code>method</code>	exact/conditional maximum likelihood.
<code>digits</code>	number of significant digits to use when printing.
<code>envir</code>	environment in which the function arguments are evaluated. If <code>NULL</code> the calling environment of this function will be used.
<code>...</code>	additional arguments.

**Value**

A list with the summary of the estimation and diagnosis.

**Examples**

```
z <- AirPassengers  
airl <- um(z, i = list(1, c(1,12)), ma = list(1, c(1,12)), bc = TRUE)  
summary(airl)
```

`sum_um`*Sum of univariate (ARIMA) models***Description**

`sum_um` creates a univariate (ARIMA) model from the sum of several univariate (arima) models.

**Usage**

```
sum_um(...)
```

**Arguments**

...	List of "um" S3 objects.
-----	--------------------------

**Value**

A "um" S3 object.

**Examples**

```
um1 <- um(i = "(1 - B)", ma = "(1 - 0.8B)")
um2 <- um(i = "(1 - B12)", ma = "(1 - 0.8B^12)")
um3 <- sum_um(um1, um2)
```

`tf`*Transfer function for input***Description**

`tf` creates a rational transfer function for an input,  $V(B) = w_0(1 - w_1B - \dots - w_qB^q)/(1 - d_1B - \dots - d_pB^p)B^dX_t$ . Note that in this specification the constant term of the MA polynomial is factored out so that both polynomials in the numerator and denominator are normalized and can be specified with the `lagpol` function in the same way as the operators of univariate models.

**Usage**

```
tf(
  x = NULL,
  delay = 0,
  w0 = 0,
  ar = NULL,
  ma = NULL,
  um = NULL,
  n.back = NULL,
  par.prefix = "",
  envir = NULL
)
```

### Arguments

<code>x</code>	input, a ts object or a numeric vector.
<code>delay</code>	integer.
<code>w0</code>	constant term of the polynomial $V(B)$ , double.
<code>ar</code>	list of stationary AR polynomials.
<code>ma</code>	list of MA polynomials.
<code>um</code>	univariate model for stochastic input.
<code>n.back</code>	number of backcasts to extend the input.
<code>par.prefix</code>	prefix name for parameters.
<code>envir</code>	environment in which the function arguments are evaluated. If NULL the calling environment of this function will be used.

### Value

An object of the class "tf".

### References

- Box, G.E., Jenkins, G.M., Reinsel, G.C. and Ljung, G.M. (2015) Time Series Analysis: Forecasting and Control. John Wiley & Sons, Hoboken.
- Wei, W.W.S. (2006) Time Series Analysis Univariate and Multivariate Methods. 2nd Edition, Addison Wesley, New York, 33-59.

### See Also

[um](#).

### Examples

```
x <- rep(0, 100)
x[50] <- 1
tfx <- tf(x, w0 = 0.8, ar = "(1 - 0.5B)(1 - 0.7B^12)")
```

### Description

`tfest` provides preestimates of the transfer function between an output and an input.

**Usage**

```
tfest(
  y,
  x,
  delay = 0,
  p = 1,
  q = 2,
  um.y = NULL,
  um.x = NULL,
  n.back = NULL,
  par.prefix = "",
  envir = NULL
)
```

**Arguments**

y	output, a ts object or a numeric vector.
x	input, a ts object or a numeric vector.
delay	integer.
p	order of the AR polynomial, integer
q	order of the MA polynomial, integer.
um.y	univariate model for output, um object or NULL.
um.x	univariate model for input, um object or NULL.
n.back	number of backcasts.
par.prefix	prefix name for parameters.
envir	environment in which the function arguments are evaluated. If NULL the calling environment of this function will be used.

**Value**

A "tf" S3 object

**Description**

tfm creates a multiple input transfer function model.

**Usage**

```
tfm(  
  output = NULL,  
  xreg = NULL,  
  inputs = NULL,  
  noise,  
  fit = TRUE,  
  envir = NULL,  
  new.name = TRUE,  
  ...  
)
```

**Arguments**

output	a ts object or a numeric vector.
xreg	a matrix of regressors.
inputs	a list of tf objects.
noise	a um object for the noise.
fit	logical. If TRUE, model is fitted.
envir	environment in which the function arguments are evaluated. If NULL the calling environment of this function will be used.
new.name	logical. Argument used internally: if TRUE a new name is assigned to the output, otherwise it keeps its name saved in noise\$z.
...	additional arguments.

**Value**

An object of the class `tfm`.

**References**

Box, G.E., Jenkins, G.M., Reinsel, G.C. and Ljung, G.M. (2015) Time Series Analysis: Forecasting and Control. John Wiley & Sons, Hoboken.

**See Also**

`tf` and `um`.

theta	<i>Unscramble MA polynomial</i>
-------	---------------------------------

### Description

Unscramble MA polynomial

### Usage

```
theta(um)

## S3 method for class 'um'
theta(um)
```

### Arguments

um	an object of class um.
----	------------------------

### Value

A numeric vector  $c(1, a_1, \dots, a_d)$

### Note

This function returns the member variable `um$theta`.

### Examples

```
um1 <- um(ma = "(1 - 0.8B)(1 - 0.5B)")
theta(um1)
```

tsdiag.tfm	<i>Diagnostic Plots for Time-Series Fits Description</i>
------------	--

### Description

`tsdiag.tfm` is a wrap of the `stats::tsdiag` function.

### Usage

```
## S3 method for class 'tfm'
tsdiag(object, gof.lag = 10, ...)
```

**Arguments**

- |         |   |
|---------|---|
| object  | a fitted um object.   |
| gof.lag | the maximum number of lags for a Portmanteau goodness-of-fit test |
| ...     | additional arguments.   |

**See Also**

stats::tsdiag.

---

tsdiag.um

*Diagnostic Plots for Time-Series Fits Description*

---

**Description**

tsdiag.um is a wrap of the stats::tsdiag function.

**Usage**

```
## S3 method for class 'um'  
tsdiag(object, gof.lag = 10, ...)
```

**Arguments**

- |         |   |
|---------|---|
| object  | a fitted um object.   |
| gof.lag | the maximum number of lags for a Portmanteau goodness-of-fit test |
| ...     | additional arguments.   |

**See Also**

stats::tsdiag.

---

tsvalue

*Value of a time series at a date*

---

**Description**

tsvalue select a value from a time series by date.

**Usage**

```
tsvalue(x, date)
```

**Arguments**

- x** an **ts** object.  
**date** the time of the specific observation, `c(year, month/quarter)`.

**Value**

The value of the observation, double.

**ucomp.tfm***Unobserved components***Description**

`ucomp` estimates the unobserved components of a time series (trend, seasonal, cycle, stationary and irregular) from the eventual forecast function.

**Usage**

```
## S3 method for class 'tfm'
ucomp(
  mdl,
  y = NULL,
  method = c("mixed", "forecast", "backcast"),
  envir = NULL,
  ...
)
ucomp(mdl, ...)

## S3 method for class 'um'
ucomp(
  mdl,
  z = NULL,
  method = c("mixed", "forecast", "backcast"),
  envir = NULL,
  ...
)
```

**Arguments**

- mdl** an object of class **um** or **tfm**.  
**y** an object of class **ts**.  
**method** forward/backward forecasts or a mixture of the two.  
**envir** environment in which the function arguments are evaluated. If `NULL` the calling environment of this function will be used.  
**...** additional arguments.  
**z** an object of class **ts**.

**Value**

A matrix with the unobserved components.

**Examples**

```
Z <- AirPassengers
um1 <- um(Z, i = list(1, c(1, 12)), ma = list(1, c(1, 12)), bc = TRUE)
uc <- ucomp(um1)
```

um

*Univariate (ARIMA) model***Description**

`um` creates an S3 object representing a univariate ARIMA model, which can contain multiple AR, I and MA polynomials, as well as parameter restrictions.

**Usage**

```
um(
  z = NULL,
  ar = NULL,
  i = NULL,
  ma = NULL,
  mu = NULL,
  sig2 = 1,
  bc = FALSE,
  fit = TRUE,
  envir = parent.frame(),
  ...
)
```

**Arguments**

<code>z</code>	an object of class <code>ts</code> .
<code>ar</code>	list of stationary AR lag polynomials.
<code>i</code>	list of nonstationary AR (I) polynomials.
<code>ma</code>	list of MA polynomials.
<code>mu</code>	mean of the stationary time series.
<code>sig2</code>	variance of the error.
<code>bc</code>	logical. If TRUE logs are taken.
<code>fit</code>	logical. If TRUE, model is fitted.
<code>envir</code>	the environment in which to look for the time series <code>z</code> when it is passed as a character string.
<code>...</code>	additional arguments.

**Value**

An object of class `um`.

**References**

Box, G.E.P., Jenkins, G.M., Reinsel, G.C. and Ljung, G.M. (2015) Time Series Analysis: Forecasting and Control. John Wiley & Sons, Hoboken.

**Examples**

```
ar1 <- um(ar = "(1 - 0.8B)")
ar2 <- um(ar = "(1 - 1.4B + 0.8B^2)")
ma1 <- um(ma = "(1 - 0.8B)")
ma2 <- um(ma = "(1 - 1.4B + 0.8B^2)")
arma11 <- um(ar = "(1 - 1.4B + 0.8B^2)", ma = "(1 - 0.8B)")
```

**varsel***Variable selection***Description**

`varsel` omits non-significant inputs from a transfer function model.

**Usage**

```
varsel(tfm, ...)
## S3 method for class 'tfm'
varsel(tfm, y = NULL, p.value = 0.1, envir = NULL, ...)
```

**Arguments**

<code>tfm</code>	a <code>tfm</code> object.
<code>...</code>	other arguments.
<code>y</code>	a "ts" object.
<code>p.value</code>	probability value to decide whether or not to omit an input.
<code>envir</code>	environment in which the function arguments are evaluated. If <code>NULL</code> the calling environment of this function will be used.

**Value**

A `tfm` object or a "um" if no input is significant at that level.

---

Wtelephone

*Wisconsin Telephone Company*

---

### Description

Monthly data from January 1951 to October 1966.

### Usage

Wtelephone

### Format

A object of class data.frame with 215 rows and 2 columns:

**X** Monthly outward station movements.

**Y** Montly inward station movements.

### Source
